

pst-plot

plotting data and functions

v.1.92

Timothy Van Zandt

Herbert Voß

July 16, 2019

This version of `pst-plot` uses the extended keyval handling of `pst-xkey` and has a lot of the macros which were recently in the package `pstricks-add`. This documentation describes only the new and changed stuff. For the default behaviour look into the documentation part of the base `pstricks` package. You find the documentation here: <http://mirrors.ctan.org/graphics/pstricks/base/doc/>.

Part I.

Basic commands, connections and labels

1. Introduction

The plotting commands described in this part are defined in the very first version of `pst-plot.tex` and available for all new and ancient versions.

The `\psdots`, `\psline`, `\pspolygon`, `\pscurve`, `\psecurve` and `\psccurve` graphics objects let you plot data in a variety of ways. However, first you have to generate the data and enter it as coordinate pairs x, y . The plotting macros in this section give you other ways to get and use the data.

To parameter `plotstyle=style` determines what kind of plot you get. Valid styles are `dots`, `line`, `polygon`, `curve`, `ecurve`, `ccurve`. E.g., if the `plotstyle` is `polygon`, then the macro becomes a variant of the `\pspolygon` object.

You can use arrows with the plot styles that are open curves, but there is no optional argument for specifying the arrows. You have to use the `arrows` parameter instead.

No PostScript error checking is provided for the data arguments. There are system-dependent limits on the amount of data \TeX and PostScript can handle. You are much less likely to exceed the PostScript limits when you use the `line`, `polygon` or `dots` plot style, with `showpoints=false`, `linearc=0pt`, and no arrows.

Note that the lists of data generated or used by the plot commands cannot contain units. The values of `\psxunit` and `\psyunit` are used as the unit.

2. Plotting data records

```
\fileplot [Options] {file}
\psfileplot [Options] {file}
\dataplot [Options] {\langle macro\rangle}
\psdataplot [Options] {\langle macro\rangle}
\savedata{\langle macro\rangle}[data]
\readdata{\langle macro\rangle}{file}
\psreadDataColumn [Options] {colNo}{delimiter}{\langle macro\rangle}{filename}
\listplot{data}
\pslistplot{data}
```

The macros with a preceeding `ps` are equivalent to those without.

`\fileplot` is the simplest of the plotting functions to use. You just need a file that contains a list of coordinates (without units), such as generated by Mathematica or other mathematical packages. The data can be delimited by curly braces `{ }`, parentheses `()`, commas, and/or white space. Bracketing all the data with square brackets `[]` will significantly speed up the rate at which the data is read, but there are system-dependent limits on how much data \TeX can read like this in one chunk. (The `[` must go at the beginning of a line.) The file should not contain anything else (not even `\endinput`), except for comments marked with `%`.

`\fileplot` only recognizes the `line`, `polygon` and `dots` plot styles, and it ignores the arrows,

`linearc` and `showpoints` parameters. The `\listplot` command, described below, can also plot data from file, without these restrictions and with faster T_EX processing. However, you are less likely to exceed PostScript's memory or operand stack limits with `\fileplot`.

If you find that it takes T_EX a long time to process your `\fileplot` command, you may want to use the `\PSTtoEPS` command described on page ???. This will also reduce T_EX's memory requirements.

`\dataplot` is also for plotting lists of data generated by other programs, but you first have to retrieve the data with one of the following commands: *data* or the data in *file* should conform to the rules described above for the data in `\fileplot` (with `\savedata`, the data must be delimited by [], and with `\readdata`, bracketing the data with [] speeds things up). You can concatenate and reuse lists, as in

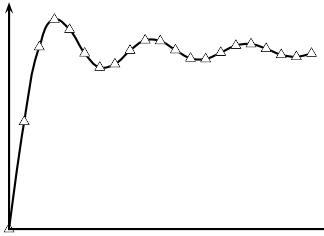

```
\readdata{\foo}{data/foo.data}
\readdata{\bar}{data/bar.data}
\dataplot{\foo\bar}
\dataplot[origin={0,1}]{\bar}
```

The `\readdata` and `\dataplot` combination is faster than `\fileplot` if you reuse the data. `\fileplot` uses less of T_EX's memory than `\readdata` and `\dataplot` if you are also use `\PSTtoEPS`.

Here is a plot of $\int \sin(x)dx$. The data was generated by Mathematica, with

```
Table[{x,N[SinIntegral[x]]},{x,0,20}]
```

and then copied to this document.

```
\pspicture(4,3) \psset{xunit=.2cm,yunit=1.5cm}
\savedata{\mydata}[
 {{0, 0}, {1., 0.946083}, {2., 1.60541}, {3., 1.84865}, {4., 1.7582},
 {5., 1.54993}, {6., 1.42469}, {7., 1.4546}, {8., 1.57419},
 {9., 1.66504}, {10., 1.65835}, {11., 1.57831}, {12., 1.50497},
 {13., 1.49936}, {14., 1.55621}, {15., 1.61819}, {16., 1.6313},
 {17., 1.59014}, {18., 1.53661}, {19., 1.51863}, {20., 1.54824}}]
\dataplot[plotstyle=curve,showpoints,dotstyle=triangle]{\mydata}
\psline{<->}(0,2)(0,0)(22,0)
\endpspicture
```

`\listplot` is yet another way of plotting lists of data. This time, `<list>` should be a list of data (coordinate pairs), delimited only by white space. *list* is first expanded by T_EX and then by PostScript. This means that *list* might be a PostScript program that leaves on the stack a list of data, but you can also include data that has been retrieved with `\readdata` and `\dataplot`. However, when using the `line`, `polygon` or `dots` plotstyles with `showpoints=false`, `linearc=0pt` and no arrows, `\dataplot` is much less likely than `\listplot` to exceed PostScript's memory or stack limits. In the preceding example, these restrictions were not satisfied, and so the example is equivalent to when `\listplot` is used:

```
...
\listplot[plotstyle=curve,showpoints=true,dotstyle=triangle]{\mydata}
...
```

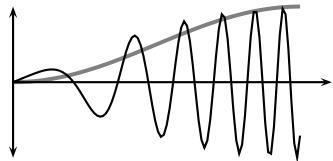

3. Plotting mathematical functions

```
\psplot [Options] {x_min@}{x_max@}{function}
\parametricplot [Options] {t_min@}{t_max@}{x(t) y(t)}
\parametricplot [algebraic,...] {t_min@}{t_max@}{x(t) / y(t)}
```

`\psplot` can be used to plot a function $f(x)$, if you know a little PostScript. *function* should be the PostScript or algebraic code for calculating $f(x)$. Note that you must use x as the dependent variable.

```
\psplot[plotpoints=200]{0}{720}{x sin}
```

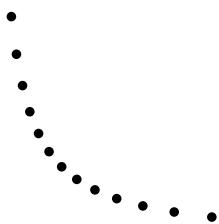

plots $\sin(x)$ from 0 to 720 degrees, by calculating $\sin(x)$ roughly every 3.6 degrees and then connecting the points with `\psline`. Here are plots of $\sin(x) \cos((x/2)^2)$ and $\sin^2(x)$:

```
\pspicture(0,-1)(4,1)
\psset{xunit=1.2pt}
\psplot[linecolor=gray,linewidth=1.5pt,plotstyle=curve]{0}{90}{x sin dup mul}
\psplot[plotpoints=100]{0}{90}{x sin x 2 div 2 exp cos mul}
\psline{<->}(0,-1)(0,1) \psline{->}(100,0)
\endpspicture
```

`\parametricplot` is for a parametric plot of $(x(t), y(t))$. *function* is the PostScript code or algebraic expression for calculating the pair $x(t)$ $y(t)$. For an algebraic expression they must be devided by a vertical rule.

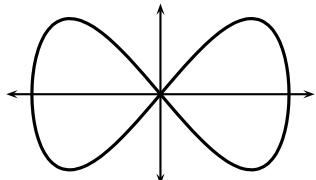

For example,

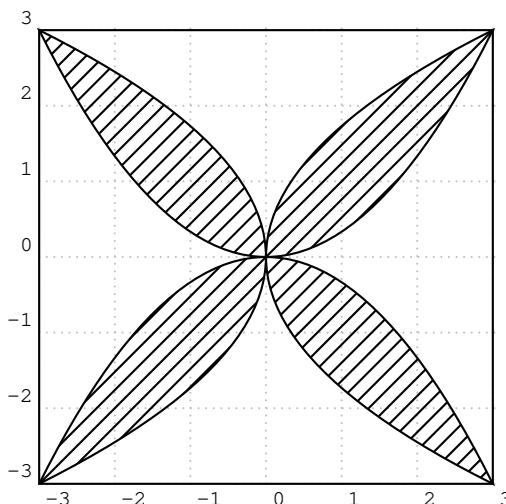

```
\pspicture(3,3)
\parametricplot[plotstyle=dots,plotpoints=13]%
{-6}{6}{1.2 t exp 1.2 t neg exp}
\endpspicture
```

plots 13 points from the hyperbola $xy = 1$, starting with $(1.2^{-6}, 1.2^6)$ and ending with $(1.2^6, 1.2^{-6})$.

Here is a parametric plot of $(\sin(t), \sin(2t))$:

```
\pspicture(-2,-1)(2,1)
\psset{xunit=1.7cm}
\parametricplot[linewidth=1.2pt,plotstyle=ccurve]%
{0}{360}{t sin t 2 mul sin}
\psline{<->}(0,-1.2)(0,1.2)
\psline{<->}(-1.2,0)(1.2,0)
\endpspicture
```

```
\begin{pspicture}[showgrid,algebraic](-3,-3)(3,3)
\psframe[dimen=m](-3,-3)(3,3)
\pscustom[fillstyle=hlines]{%
\psplot{-3}{3}{-x^2/3}
\psparametricplot{-3}{3}{t^2/3 + t}
\psplot{3}{-3}{x^2/3}
\psparametricplot{3}{-3}{-t^2/3 + t}
}
\end{pspicture}
```

The number of points that the `\psplot` and `\parametricplot` commands calculate is set by the `plotpoints=<value>` parameter. Using "curve" or its variants instead of "line" and increasing the value of `plotpoints` are two ways to get a smoother curve. Both ways increase the imaging time. Which is better depends on the complexity of the computation. (Note that all PostScript lines are ultimately rendered as a series (perhaps short) line segments.) Mathematica generally uses "lineto" to connect the points in its plots. The default minimum number of plot points for Mathematica is 25, but unlike `\psplot` and `\parametricplot`, Mathematica increases the sampling frequency on sections of the curve with greater fluctuation.

Part II.

New commands

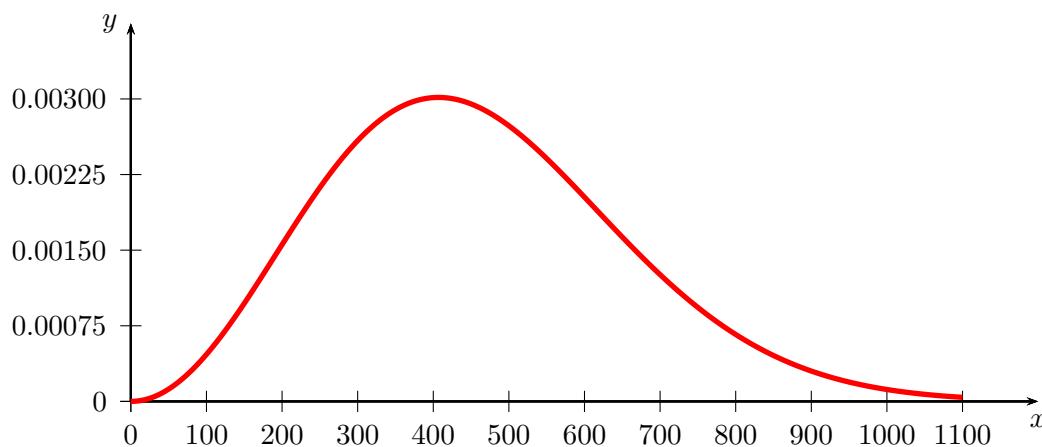

4. Extended syntax for `\psplot`, `\psparametricplot`, and `\psaxes`

There is now a new optional argument for `\psplot` and `\psparametricplot` to pass additional PostScript commands into the code. This makes the use of `\pstVerb` in most cases superfluous.

<code>\psplot [Options] {x0}{x1} [PS commands] {function}</code>
<code>\psparametricplot [Options] {t0}{t1} [PS commands] {x(t) y(t)}</code>
<code>\psparametricplot [algebraic,...] {t0}{t1} [PS commands] {x(t) / y(t)}</code>
<code>\psaxes [Options] {arrows} (x₀,y₀)(x₁,y₁)(x₂,y₂) [Xlabel,Xangle] [Ylabel,Yangle]</code>

The macro `\psaxes` has now four optional arguments, one for the setting, one for the arrows, one for the x-label and one for the y-label. If you want only a y-label, then leave the x one empty. A missing y-label is possible. The following examples show how it can be used.

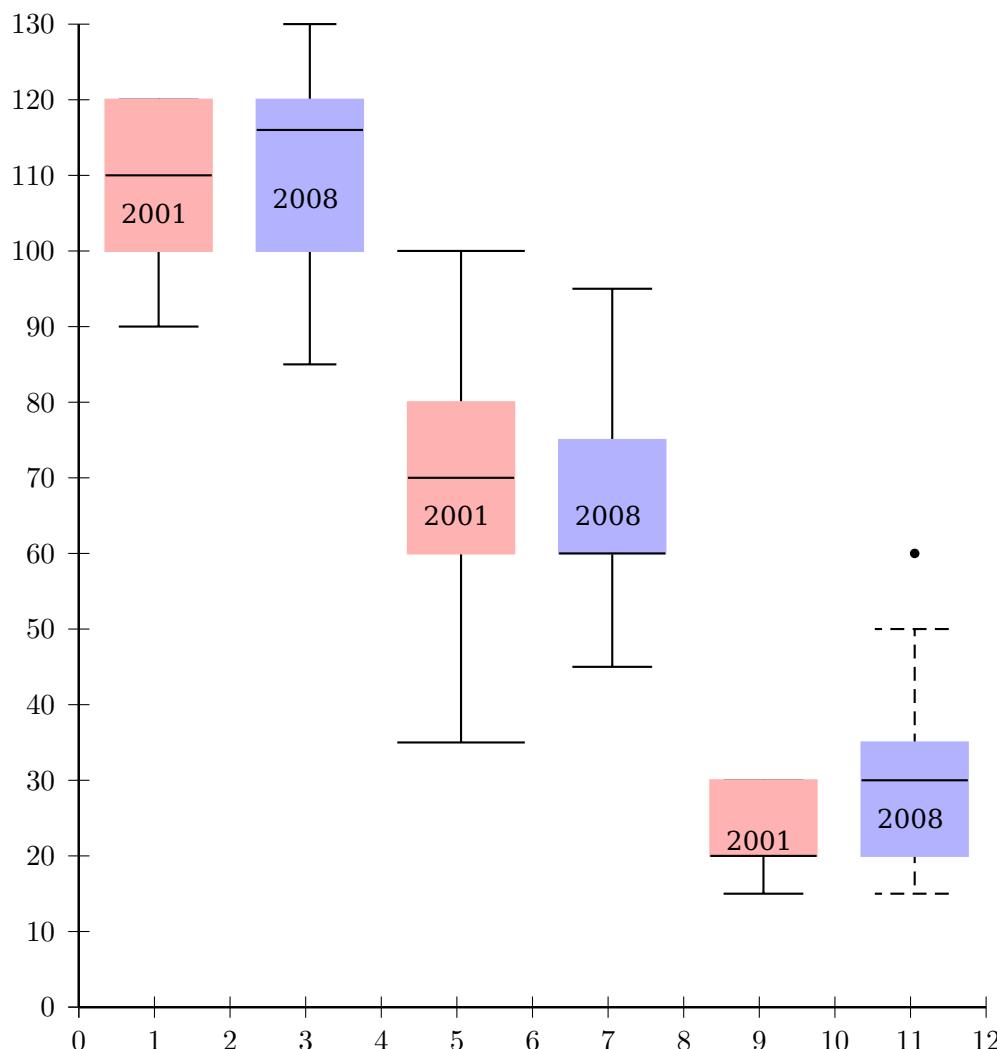

```
\begin{pspicture}(-1,-0.5)(12,5)
\psaxes[Dx=100,dx=1,Dy=0.00075,dy=1]{->}(0,0)(12,5)[x$,-90][y$,180]
\psplot[linecolor=red, plotstyle=curve, linewidth=2pt, plotpoints=200]{0}{11}%
[ /const1 3.3 10 8 neg exp mul def
/s 10 def
/const2 6.04 10 6 neg exp mul def ] % optional PS commands
{ const1 x 100 mul dup mul mul Euler const2 neg x 100 mul dup mul mul exp mul 2000 mul}
\end{pspicture}
```

5. New Macro \psBoxplot

A box-and-whisker plot (often called simply a box plot) is a histogram-like method of displaying data, invented by John Tukey. The box-and-whisker plot is a box with ends at the quartiles Q_1 and Q_3 and has a statistical median M as a horizontal line in the box. The "whiskers" are lines to the farthest points that are not outliers (i.e., that are within $3/2$ times the interquartile range of Q_1 and Q_3). Then, for every point more than $3/2$ times the interquartile range from the end of a box, is a dot.

The only special optional arguments, beside all other which are valid for drawing lines and filling areas, are `IQLfactor`, `barwidth`, and `arrowlength`, where the latter is a factor which is multiplied with the barwidth for the line ends. The `IQLfactor`, preset to 1.5, defines the area for the outliers. The outliers are plotted as a dot and take the settings for such a dot into account, eg. `dotstyle`, `dotscale`, and `fillcolor`. The default is the black dot.

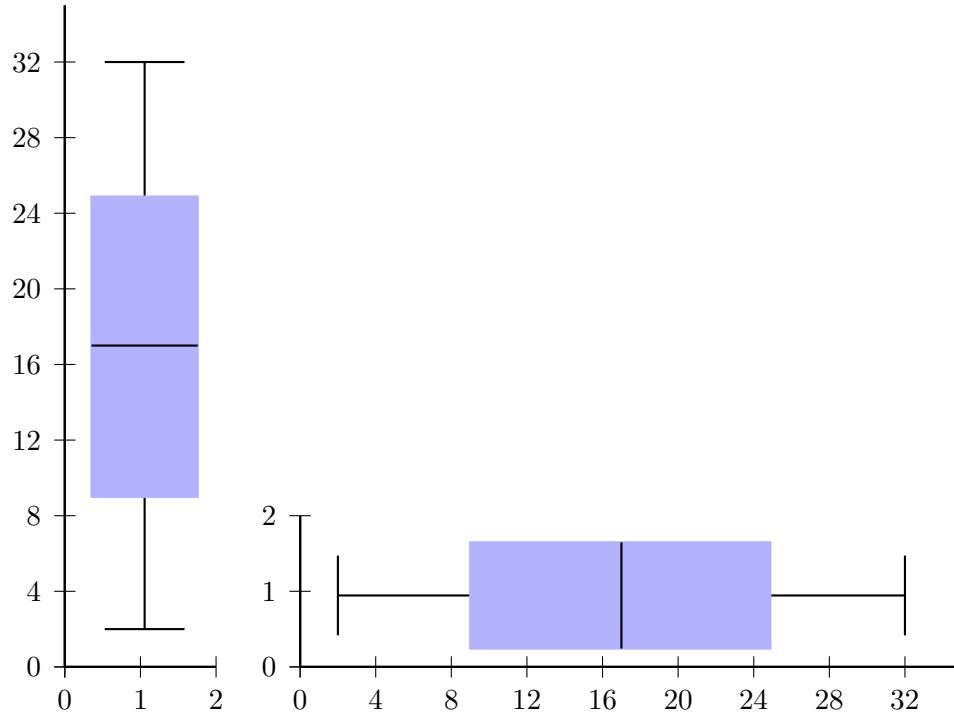

```
\begin{pspicture}(-1,-1)(12,14)
\psset{yunit=0.1,fillstyle=solid}
\savedata{\data}{100 90 120 115 120 110 100 110 100 90 100 100 120 120 120}
\rput(1,0){\psBoxplot[fillcolor=red!30]{\data}}
\rput(1,105){2001}
\savedata{\data}{90 120 115 116 115 110 90 130 120 120 120 85 100 130 130}
\rput(3,0){\psBoxplot[arrowlength=0.5,fillcolor=blue!30]{\data}}

```

```
\rput(3,107){2008}
\savedata{\data}[35 70 90 60 100 60 60 80 80 60 50 55 90 70 70]
\rput(5,0){\psBoxplot[barwidth=40pt,arrowlength=1.2,fillcolor=red!30]{\data}}
\rput(5,65){2001}
\savedata{\data}[60 65 60 75 75 60 50 90 95 60 65 45 45 60 90]
\rput(7,0){\psBoxplot[barwidth=40pt,fillcolor=blue!30]{\data}}
\rput(7,65){2008}
\savedata{\data}[20 20 25 20 15 20 20 25 30 20 20 20 30 30 30]
\rput(9,0){\psBoxplot[fillcolor=red!30]{\data}}
\rput(9,22){2001}
\savedata{\data}[20 30 20 35 35 20 20 60 50 20 35 15 30 20 40]
\rput(11,0){\psBoxplot[fillcolor=blue!30,linestyle=dashed]{\data}}
\rput(11,25){2008}
\psaxes[dy=1cm,Dy=10](0,0)(12,130)
\end{pspicture}
```

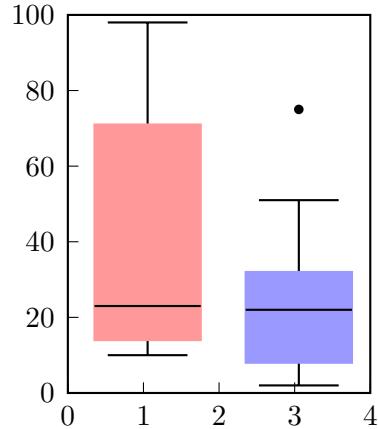

The next example uses an external file for the data, which must first be read by the macro \readdata. The next one creates a horizontal boxplot by rotating the output with -90 degrees.

```
\readdata{\data}{data/boxplot.data}
\begin{pspicture}(-1,-1)(2,10)
\psset{yunit=0.25,fillstyle=solid}
\savedata{\data}[2 4 6 8 10 12 14 16 18 20 22 24 26 28 30 32]
\rput(1,0){\psBoxplot[fillcolor=blue!30]{\data}}
\psaxes[dy=1cm,Dy=4](0,0)(2,35)
\end{pspicture}
%
\begin{pspicture}(-1,-1)(11,2)
\psset{xunit=0.25,fillstyle=solid}
\savedata{\data}[2 4 6 8 10 12 14 16 18 20 22 24 26 28 30 32]
```

```
\rput{-90}(0,1){\psBoxplot[yunit=0.25,fillcolor=blue!30]{\data}}
\psaxes[dx=1cm,Dx=4](0,0)(35,2)
\end{pspicture}
```

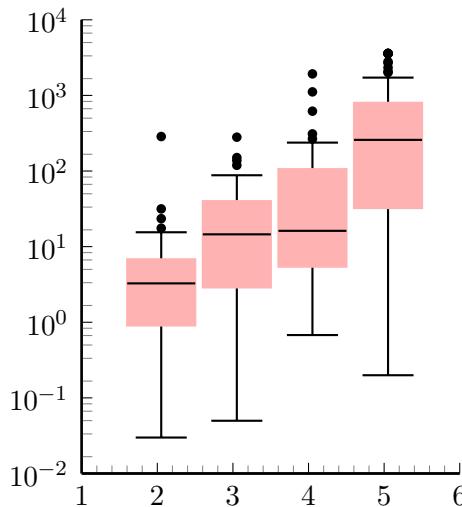

It is also possible to read a data column from an external file:

```
\begin{filecontents*}{data/Data.dat}
98, 32
20, 11
79, 26
14, 9
23, 22
21, 10
58, 25
13, 8
19, 5
53, 29
41, 37
11, 2
83, 25
71, 51
10, 7
89, 17
10, 6
, 41
, 75
\end{filecontents*}

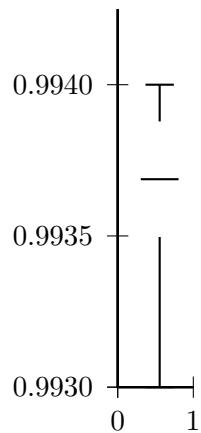

\begin{pspicture}(-1,-1)(5,6)
\psaxes[axesstyle=frame,dy=1cm,Dy=20,tickscale=4pt 0](0,0)(4,5)
\psreadDataColumn{1}{,}{\data}{data/Data.dat}
\rput(1,0){\psBoxplot[fillcolor=red!40,yunit=0.05]{\data}}
\psreadDataColumn{2}{,}{\data}{data/Data.dat}
\rput(3,0){\psBoxplot[fillcolor=blue!40,yunit=0.05]{\data}}
\end{pspicture}
```

With the optional argument `postAction` one can modify the y value of the boxplot, e.g. for an output with a vertical axis in logarithm scaling:

```
\begin{pspicture}(-1,-3)(6,5)
\psset{fillstyle=solid}
\psaxes[ylogBase=10,0y=-2,0x=1,logLines=y,ticksize=0 4pt, subticks=5](1,-2)(6,4)
\rput(2,0){\psBoxplot[fillcolor=red!30,barwidth=0.9cm,postAction=Log]{
12.70 1.34 0.68 0.51 1.77 0.04 3.79 287.05 1.35 5.41 15.56 3.13 0.91 7.48
2.40 1.04 3.53 0.58 31.71 7.89 4.90 2.61 0.89 0.03 3.78 8.11 4.82 1.02 5.57
8.85 0.15 17.59 0.21 8.10 2.15 3.43 6.44 1.65 6.83 23.54 0.52 1.47 0.75
3.54 3.59 5.56 0.33 8.58 1.90 0.78 }}
\rput(3,0){\psBoxplot[fillcolor=red!30,barwidth=0.9cm,postAction=Log]{
55.72 14.91 14.95 6.01 6.53 88.30 281.50 40.15 13.41 0.91 1.65 44.32 13.41
7.33 3.51 3.44 70.40 0.75 58.20 54.88 26.45 33.76 0.70 0.05 0.29 57.12
14.30 31.11 18.56 0.48 21.33 1.15 2.22 3.88 1.78 151.25 7.77 137.92 0.50
3.01 1.99 23.18 119.59 17.50 15.87 13.63 21.85 23.53 68.72 2.90 }}
\rput(4,0){\psBoxplot[fillcolor=red!30,barwidth=0.9cm,postAction=Log]{
1.19 1.94 13.40 7.40 267.30 5.94 11.05 6.51 2.94 5.45 5.24 231 4.48 0.68
311.29 77.47 621.20 139.08 1933.59 2.52 100.96 11.02 153.43 26.67 83.84
4.31 106.34 15.90 1118.59 9.49 131.48 48.92 5.85 3.74 1.05 32.03 5.69
45.10 12.43 238.56 28.75 1.01 119.29 12.09 31.18 16.60 29.67 138.55
17.42 0.83 }}
\rput(5,0){\psBoxplot[fillcolor=red!30,barwidth=0.9cm,postAction=Log]{
2077.45 762.10 469 143.60 685 3600 20.20 249.60 269 0.30 0.20 779.40 1.80
146.80 1.30 32.50 137 2016.40 2.30 33.90 801.60 2.20 646.90 3600 1184 627
500.50 238.30 477.40 3600 17.80 1726.80 2 316.70 174.50 2802.70 335.30
201.20 1.10 247.10 2705.10 156.90 5.10 2342.50 3600 3600 72.70 47.40
301.20 1.60 }}
\end{pspicture}
```

It uses the PostScript function Log instead of log. The latter cannot handle zero values. The next examples shows how a very small intervall can be handled:

```
\psset{yunit=0.5cm}
\begin{pspicture}(-2,-1)(2,11)
\savedata{\data}[0.9936 0.9937 0.9934 0.9936 0.9937 0.9938 0.9934 0.9933 0.9930 0.9935]
\psaxes[0y=0.9930,Dy=0.0005,dy=2cm](0,0)(1,10)
\rput(.5,0){\psBoxplot[barwidth=.5\psxunit,postAction=0.993 sub 1e4 mul]{\data}}
\end{pspicture}
```

6. The psgraph environment

This new environment `psgraph` does the scaling, it expects as parameter the values (without units!) for the coordinate system and the values of the physical width and height (with units!). The syntax is:

```
\psgraph [Options] {<arrows>}%
  (xOrig,yOrig) (xMin,yMin) (xMax,yMax) {xLength}{yLength}%
...
\endpsgraph

\begin{psgraph} [Options] {<arrows>}%
  (xOrig,yOrig) (xMin,yMin) (xMax,yMax) {xLength}{yLength}%
...
\end{psgraph}
```

where the options are valid **only** for the the `\psaxes` macro. The first two arguments have the usual PSTricks behaviour.

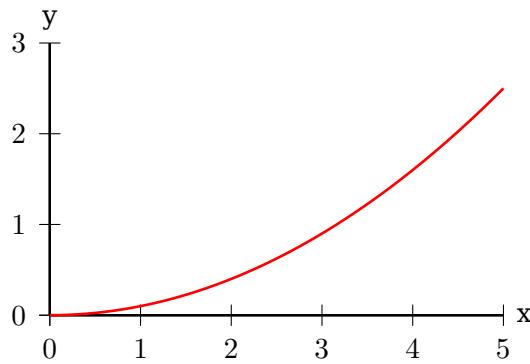

- if `(xOrig,yOrig)` is missing, it is substituted to `(xMin,xMax)`;
- if `(xOrig,yOrig)` **and** `(xMin,yMin)` are missing, they are both substituted to `(0,0)`.

The y-length maybe given as `!`; then the macro uses the same unit as for the x-axis.

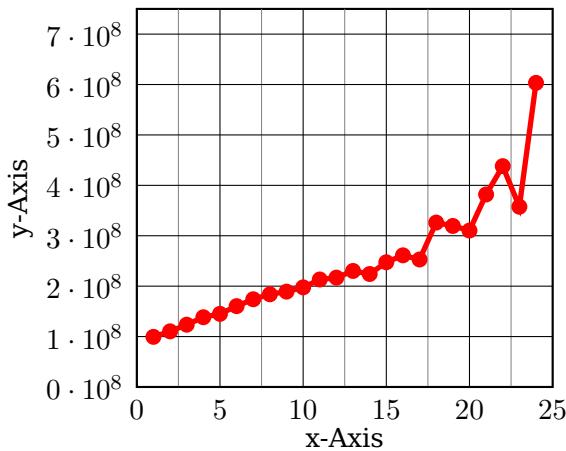

```
\readdata{\data}{data/demo1.data}
\pstScalePoints(1,1e-08){}{% (x,y){additional x operator}{y op}

An example with ticks on every side of the frame and filled areas:

```
\def\data{0 0 1 4 1.5 1.75 2.25 4 2.75 7 3 9}
\psset{lly=-0.5cm}
\begin{psgraph}[axesstyle=none,ticks=none,labels=none](0,0)(3.0,9.0){12cm}{5cm}
\pscUSTOM[fillstyle=solid,fillcolor=red!40,linestyle=none]{%
\listplot{\data}
\psline(3,9)(3,0)}
\pscUSTOM[fillstyle=solid,fillcolor=blue!40,linestyle=none]{%
\listplot{\data}
\psline(3,9)(0,9)}
\listplot[linewidth=2pt]{\data}
\psaxes[axesstyle=frame,ticksize=0 5pt,xsubticks=20,ysubticks=4,ticks=all,labels=all,
tickstyle=inner,dy=2,Dy=2,tickwidth=1.5pt,subtickcolor=black](0,0)(3,9)
\rput*(2.5,3){level 1}\rput*(1,7){level 2}
\end{psgraph}
```

6.1. Coordinates of the *psgraph* area

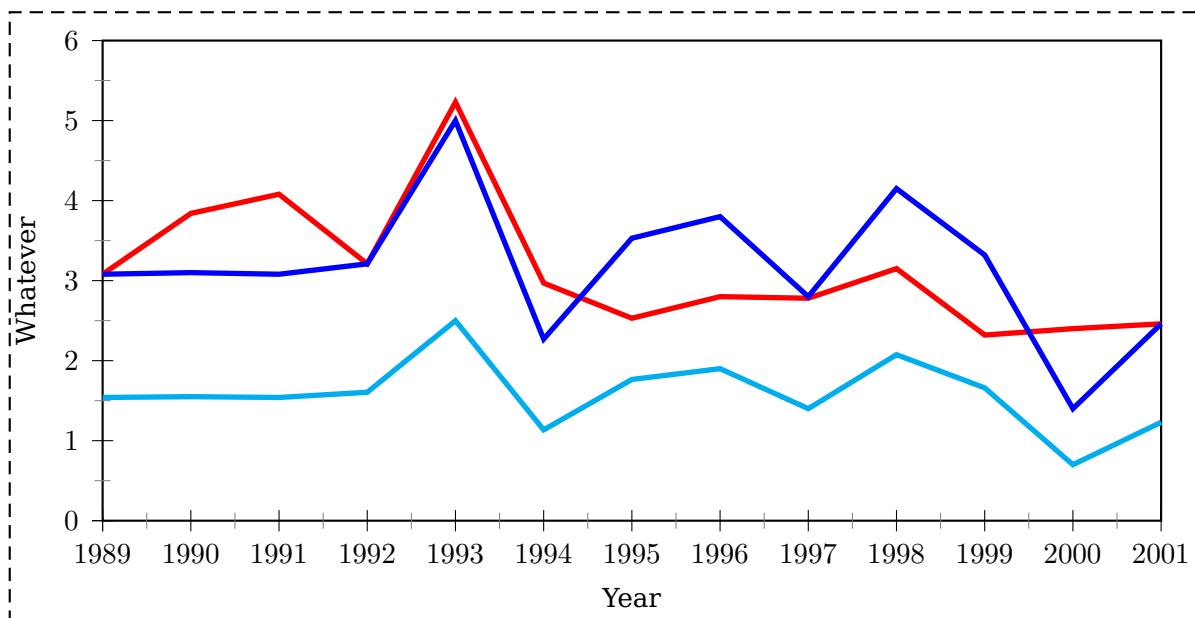

The coordinates of the calculated area are saved in the four macros `\psgraphLLx`, `\psgraphLLy`, `\psgraphURx`, and `\psgraphURy`, which is LowerLeft, UpperLeft, LowerRight, and UpperRight. The values have no dimension but are saved in the current unit.

6.2. The new options for *psgraph*

name	default	meaning
<code>xAxisLabel</code>	<code>x</code>	label for the x-axis
<code>yAxisLabel</code>	<code>y</code>	label for the y-axis
<code>xAxisLabelPos</code>	<code>{}</code>	where to put the x-label
<code>yAxisLabelPos</code>	<code>{}</code>	where to put the y-label
<code>xlabelsep</code>	<code>5pt</code>	labelsep for the x-axis labels
<code>ylabelsep</code>	<code>5pt</code>	labelsep for the x-axis labels
<code>llx</code>	<code>0pt</code>	trim for the lower left x
<code>lly</code>	<code>0pt</code>	trim for the lower left y
<code>urx</code>	<code>0pt</code>	trim for the upper right x
<code>ury</code>	<code>0pt</code>	trim for the upper right y
<code>axespos</code>	<code>bottom</code>	draw axes first (bottom or last (top))

There is one restriction in using the trim parameters, they must be set **before** `\psgraph` is called. They are redundant when used as parameters of `\psgraph` itself. The `xAxisLabelPos` and `yAxisLabelPos` options can use the letter `c` for centering an *x*-axis or *y*-axis label. The `c` is a replacement for the *x* or *y* value. When using values with units, the position is always measured from the origin of the coordinate system, which can be outside of the visible *pspicture* environment.

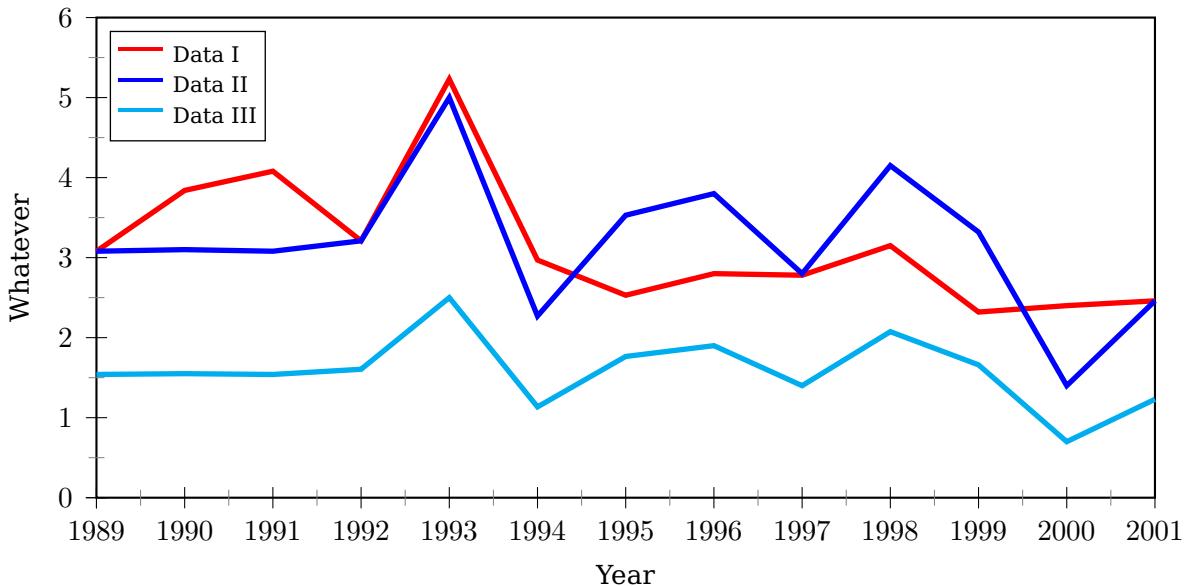

```
\readdata{\data}{data/demo2.data}%
\readdata{\dataII}{data/demo3.data}%
\psset{llx=-1cm, lly=-1.25cm, urx=0.5cm, ury=0.1in, xAxisLabel=Year, %
       yAxisLabel=Whatever, xAxisLabelPos={c, -0.4in}, %
       yAxisLabelPos={-0.4in, c}}
\pstScalePoints(1,1){1989 sub}%
\psframebox[linestyle=dashed, boxsep=false]{%
\begin{psgraph}[axesstyle=frame, 0x=1989, subticks=2](0,0)(12,6){0.8\linewidth}{2.5in}%
  \listplot[linecolor=red, linewidth=2pt]{\data}%
  \listplot[linecolor=blue, linewidth=2pt]{\dataII}%
  \listplot[linecolor=cyan, linewidth=2pt, yunit=0.5]{\dataII}%
\end{psgraph}%
}
```

6.3. The new macro `\pslegend` for *psgraph*

```
\pslegend [Reference] (xOffset,yOffset) {Text}
```

The reference can be one of the `lb`, `lt`, `rb`, or `rt`, where the latter is the default. The values for `xOffset` and `yOffset` must be multiples of the unit `pt`. Without an offset the value of `\pslabelsep` are used. The legend has to be defined *before* the environment `psgraph`.

```
\readdata{\data}{data/demo2.data}%
\readdata{\dataII}{data/demo3.data}%
\psset{llx=-1cm, lly=-1.25cm, urx=0.5cm, ury=0.1in, xLabel=Year, %
       yLabel=Whatever, xLabelPos={c, -0.4in}, %
       yLabelPos={-0.4in, c}}
\pstScalePoints(1,1){1989 sub}%
\pslegend[lt]{\red\rule[1ex]{2em}{1pt} & Data I\\
              \blue\rule[1ex]{2em}{1pt} & Data II\\
              \cyan\rule[1ex]{2em}{1pt} & Data III}
\begin{psgraph}[axesstyle=frame, 0x=1989, subticks=2](0,0)(12,6){0.8\linewidth}{2.5in}%
  \listplot[linecolor=red, linewidth=2pt]{\data}%
  \listplot[linecolor=blue, linewidth=2pt]{\dataII}%
  \listplot[linecolor=cyan, linewidth=2pt, yunit=0.5]{\dataIII}%
\end{psgraph}
```

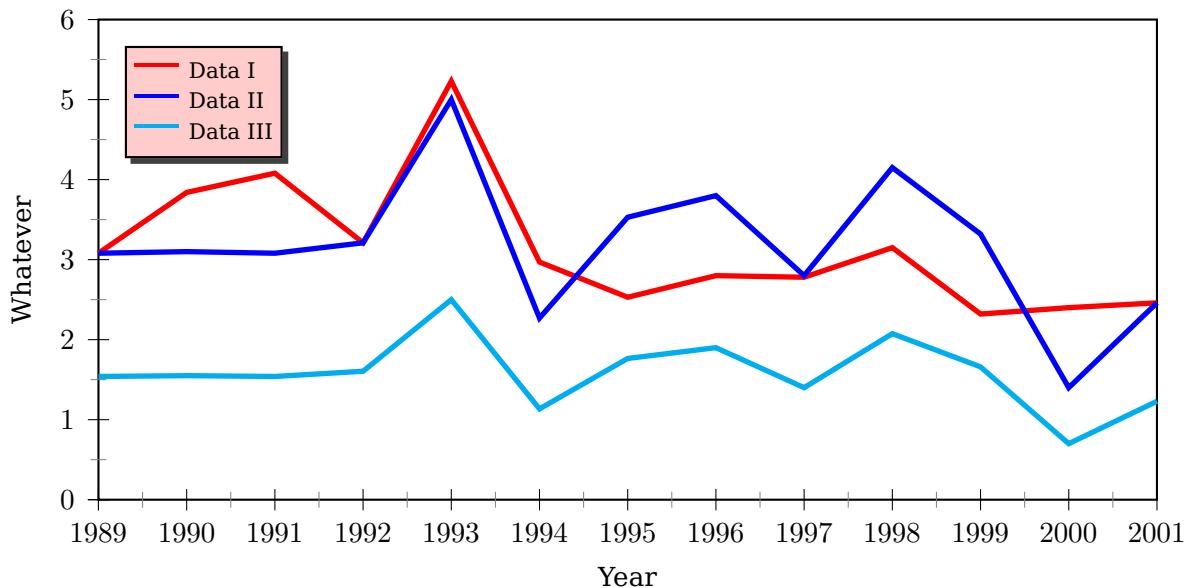

- `\pslegend` uses the commands `\tabular` and `\endtabular`, which are only available when running L^AT_EX. With T_EX you have to redefine the macro `\pslegend@ii`:

```
\def\pslegend@ii[#1](#2){\rput[#1](!#2){\psframebox[style=legendstyle]{%
  \footnotesize\tabcolsep=2pt%
  \tabular[t]{@{}ll@{}}\pslegend@text\endtabular}}\gdef\pslegend@text{}}
```

- The fontsize can be changed locally for each cell or globally, when also redefining the macro `\pslegend@ii`.
- If you want to use more than two columns for the table or a shadow box, then redefine `\pslegend@ii`.

The macro `\psframebox` uses the style `legendstyle` which is preset to `fillstyle=solid`, `fillcolor=white`, and `linewidth=0.5pt` and can be redefined by

```
\newpsstyle{legendstyle}{fillstyle=solid, fillcolor=red!20, shadow=true}
```

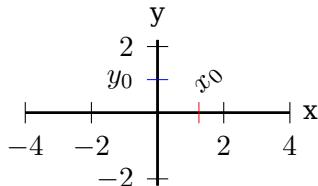

```
\readdata{\data}{data/demo2.data}%
\readdata{\dataII}{data/demo3.data}%
\psset{llx=-1cm, lly=-1.25cm, urx=0.5cm, ury=0.1in, xLabel=Year, %
       yLabel=Whatever, xLabelPos={c, -0.4in}, %
       yLabelPos={-0.4in, c}}
\pstScalePoints(1,1){1989 sub}%
\newpsstyle{legendstyle}{fillstyle=solid, fillcolor=red!20, shadow=true}
\pslegend[lt](10,10){\red\rule[1ex]{2em}{1pt} & Data I\%
                     \blue\rule[1ex]{2em}{1pt} & Data II\%
                     \cyan\rule[1ex]{2em}{1pt} & Data III}
\begin{psgraph}[axesstyle=frame, 0x=1989, subticks=2](0,0)(12,6){0.8\linewidth}{2.5in}%
  \listplot[linecolor=red, linewidth=2pt]{\data}%
  \listplot[linecolor=blue, linewidth=2pt]{\dataII}%
  \listplot[linecolor=cyan, linewidth=2pt, yunit=0.5]{\dataIII}%
\end{psgraph}%
```

7. \psxTick and \psyTick

Single ticks with labels on an axis can be set with the two macros `\psxTick` and `\psyTick`. The label is set with the macro `\pshlabel`, the setting of `mathLabel` is taken into account.

<code>\psxTick [Options] {rotation} (x value){label}</code>	<code>\psyTick [Options] {rotation} (y value){label}</code>
---	---

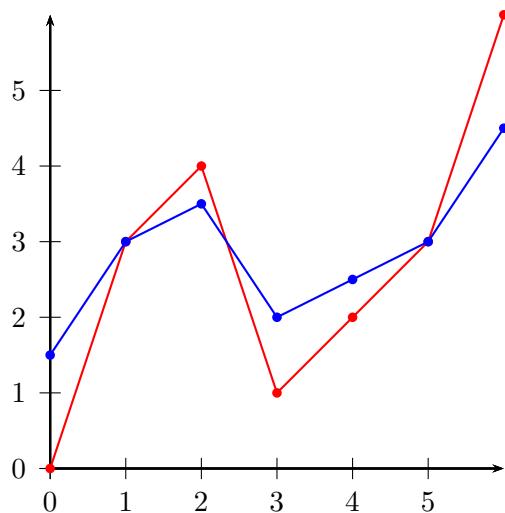

```
\begin{psgraph}[Dx=2,Dy=2,showorigin=false]%
(0,0)(-4,-2.2)(4,2.2){.5\textwidth}{!}
\psxTick[linecolor=red,labelsep=-20pt]{45}(1.25){x
_0}
\psyTick[linecolor=blue](1){y_0}
\end{psgraph}
```

8. \pstScalePoints

The syntax is

<code>\pstScalePoints(xScale,xScale){xPS}{yPS}</code>

`xScale`, `yScale` are decimal values used as scaling factors, the `xPS` and `yPS` are additional PostScript code applied to the x- and y-values of the data records. This macro is only valid for the `\listplot` macro!

```
\def\data{%
0 0 1 3 2 4 3 1
4 2 5 3 6 6 }
\begin{pspicture}(-0.5,-1)(6,6)
\psaxes{->}(0,0)(6,6)
\listplot[showpoints=true,%
linecolor=red]{\data}
\pstScalePoints(1,0.5){}{3 add}
\listplot[showpoints=true,%
linecolor=blue]{\data}
\end{pspicture}
```

`\pstScalePoints(1,0.5){}{3 add}` means that **first** the value 3 is added to the `y` values and **second** this value is scaled with the factor 0.5. As seen for the blue line for $x = 0$ we get $y(0) = (0 + 3) \cdot 0.5 = 1.5$.

Changes with `\pstScalePoints` are always global to all following `\listplot` macros. This is the reason why it is a good idea to reset the values at the end of the `pspicture` environment.

9. New or extended options

9.1. Introduction

The option `tickstyle=full|top|bottom` no longer works in the usual way. Only the additional value `inner` is valid for `pst-plot`, because everything can be set by the `ticksize` option. When using the

comma or `trigLabels` option, the macros `\pshlabel` and `\psvlabel` shouldn't be redefined, because the package does it itself internally in these cases. However, if you need a redefinition, then do it for `\pst@@@hlabel` and `\pst@@@vlabel` with

```
\makeatletter
\def\pst@@@hlabel#1{...}
\def\pst@@@vlabel#1{...}
\makeatother
```

Table 1: All new parameters for `psplot`

9.2. Option `plotstyle` (Christoph Bersch)

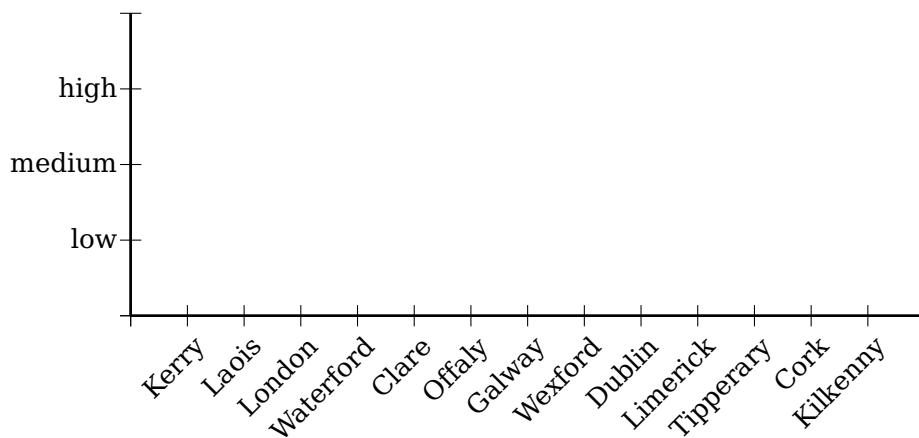

There is a new value `cspline` for the `plotstyle` to interpolate a curve with cubic splines.

```
\readdata{\foo}{data/data1.dat}
\begin{psgraph}[axesstyle=frame,ticksize=6pt,subticks=5,ury=1cm,
  0x=250,Dx=10,0y=-2,](250,-2)(310,0.2){0.8\linewidth}{0.3\linewidth}
\listplot[plotstyle=cspline,linecolor=red,linewidth=0.5pt,showpoints]{\foo}
\end{psgraph}
```

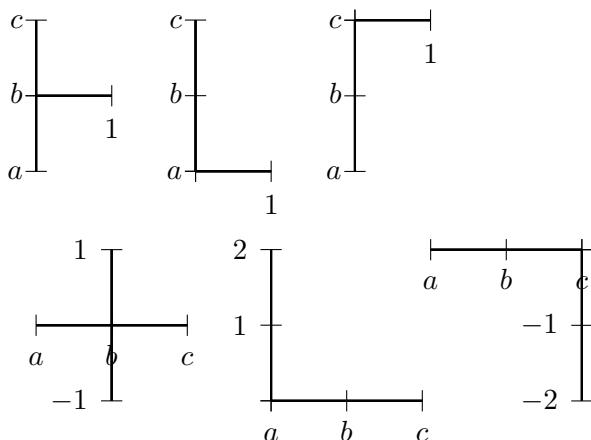

9.3. Option `xLabels`, `yLabels`, `xLabelsrot`, and `yLabelsrot`

```
\psset{xunit=0.75}
\begin{pspicture}(-2,-2)(14,4)
\psaxes[xLabels={,Kerry,Laois,London,Waterford,Clare,Offaly,%
  Galway,Wexford,Dublin,Limerick,Tipperary,Cork,Kilkenny},xLabelsRot=45,
  yLabels={,low,medium,high},mathLabel=false](14,4)
\end{pspicture}
```

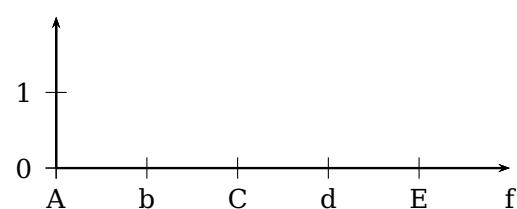

```
\begin{pspicture}(-0.5,-1.5)(1.5,1.5)
\psaxes[showorigin=false,yLabels={a,b,c}](0,0)(0,-1)(1,1)
\end{pspicture}
\begin{pspicture}(-0.5,-0.5)(1.5,2.5)
\psaxes[showorigin=false,yLabels={a,b,c}](1,2)
\end{pspicture}
\begin{pspicture}(-0.5,-2.5)(1.5,.5)
\psaxes[showorigin=false,yLabels={a,b,c}](0,0)(0,-2)(1,0)
\end{pspicture}

\begin{pspicture}(-1.5,-1.5)(1.5,1.5)
\psaxes[showorigin=false,xLabels={a,b,c}](0,0)(-1,-1)(1,1)
\end{pspicture}
\begin{pspicture}(-0.5,-0.5)(1.5,2.5)
\psaxes[showorigin=false,xLabels={a,b,c}](2,2)
\end{pspicture}
\begin{pspicture}(-2.5,-2.5)(1.5,.5)
\psaxes[showorigin=false,xLabels={a,b,c}](0,0)(-2,-2)(0,0)
\end{pspicture}
```

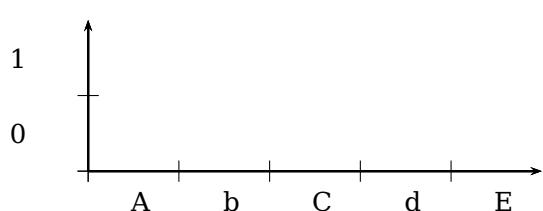

The values for `xlabelsep` and `ylabelsep` are taken into account.

9.4. Option `xLabelOffset` and `yLabelOffset`

```
\psset{xAxisLabel=,yAxisLabel=,
llx=-5mm,urx=1cm,lly=-5mm,
mathLabel=false,xlabelsep=-5pt,
xLabels={A,b,C,d,E,f}}
\begin{psgraph}{>}(5,2){6cm}{2cm}
```

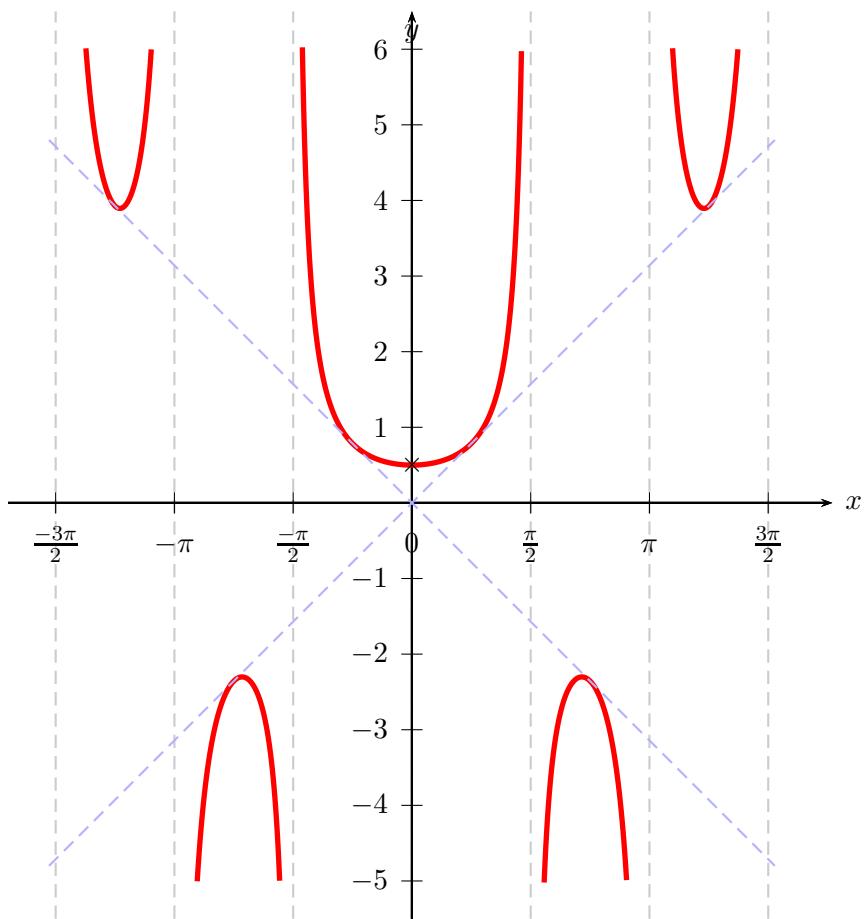

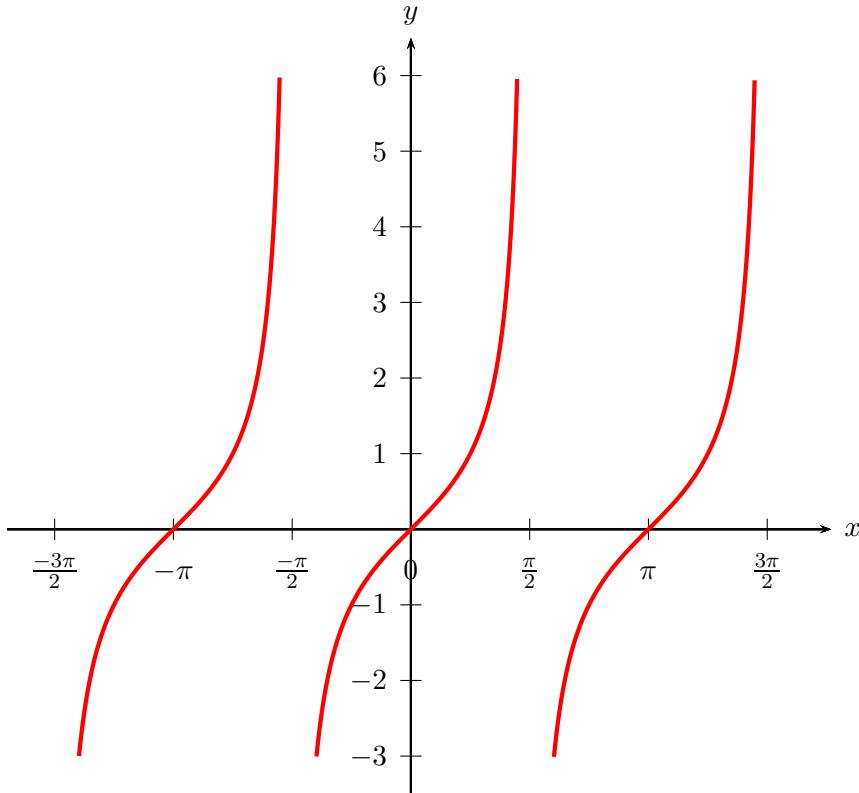

```
\psset{xAxisLabel=,yAxisLabel=,
llx=-5mm,urx=1cm,lly=-5mm,
mathLabel=false,xlabelsep=-5pt,
xLabels={A,b,C,d,E},
xLabelOffset=-0.5,
yLabelOffset=0.5}
\begin{psgraph}{>}(5,2){6cm}{2cm}
```

9.5. Option `y.MaxValue` and `y.MinValue`

With the new optional arguments `y.MaxValue` and `y.MinValue` one can control the behaviour of discontinuous functions, like the tangent function. The code does not check that `y.MaxValue` is bigger than `y.MinValue` (if not, the function is *not* plotted at all). All four possibilities can be used, i.e. one, both or none of the two arguments `y.MaxValue` and `y.MinValue` can be set.

```
\begin{pspicture}(-6.5,-6)(6.5,7.5)
\multido{\rA=-4.71239+\psPiH}{7}{%
  \psline[linecolor=black!20,linestyle=dashed](\rA,-5.5)(\rA,6.5)}
\psset{algebraic,plotpoints=10000,plotstyle=line}
\psaxes[trigLabelBase=2,dx=\psPiH,xunit=\psPi,trigLabels]
{->}(0,0)(-1.7,-5.5)(1.77,6.5)[\$x$,0][\$y$,-90]
\psclip{\psframe[linestyle=none](-4.55,-5.5)(5.55,6.5)}
\psplot[y.MaxValue=6,y.MinValue=-5,linewidth=2pt,linecolor=red]{-4.55}{4.55}{(x)/(sin(2*x))}}
\endpsclip
\psplot[linestyle=dashed, linecolor=blue!30]{-4.8}{4.8}{x}
\psplot[linestyle=dashed, linecolor=blue!30]{-4.8}{4.8}{-x}
\rput(0,0.5){$\times$}
\end{pspicture}
```

```
\begin{pspicture}(-6.5,-4)(6.5,7.5)
\psaxes[trigLabelBase=2,dx=\psPiH,xunit=\psPi,trigLabels]%
{->}(0,0)(-1.7,-3.5)(1.77,6.5)[x$,0][y$,90]
\psplot[yMaxValue=6,yMinValue=-3,linewidth=1.6pt,plotpoints=2000,
linecolor=red,algebraic]{-4.55}{4.55}{tan(x)}
\end{pspicture}
```

9.6. Option axesstyle

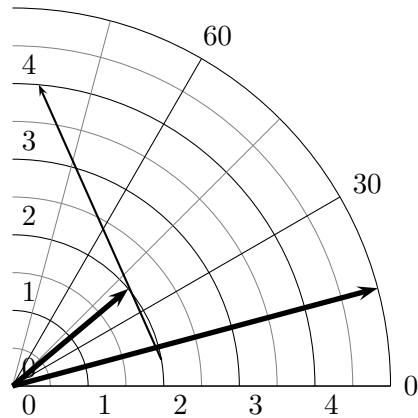

There is a new axes style `polar` which plots a polar coordinate system.

Syntax:

```
\psplot[axesstyle=polar](Rx,Angle)
\psplot[axesstyle=polar](...)(Rx,Angle)
\psplot[axesstyle=polar](...)(...)(Rx,Angle)
```

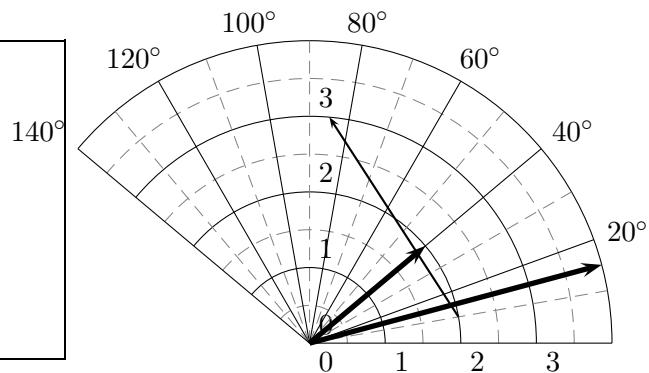

Important is the fact, that only one pair of coordinates is taken into account for the radius and the angle. It is *always* the last pair in a sequence of allowed coordinates for the `\psaxes` macro. The other ones are ignored; they are not valid for the polar coordinate system. However, if the angle is set to 0 it is changed to 360 degrees for a full circle.

```
\begin{pspicture}(-1,-1)(5.75,5.75)
\psaxes[axesstyle=polar,
subticks=2](5,90)
\psline[linewidth=2pt]{->}(5;15)
\psline[linewidth=2pt]{->}(2;40)
\psline{->}(2;10)(4;85)
\end{pspicture}
```

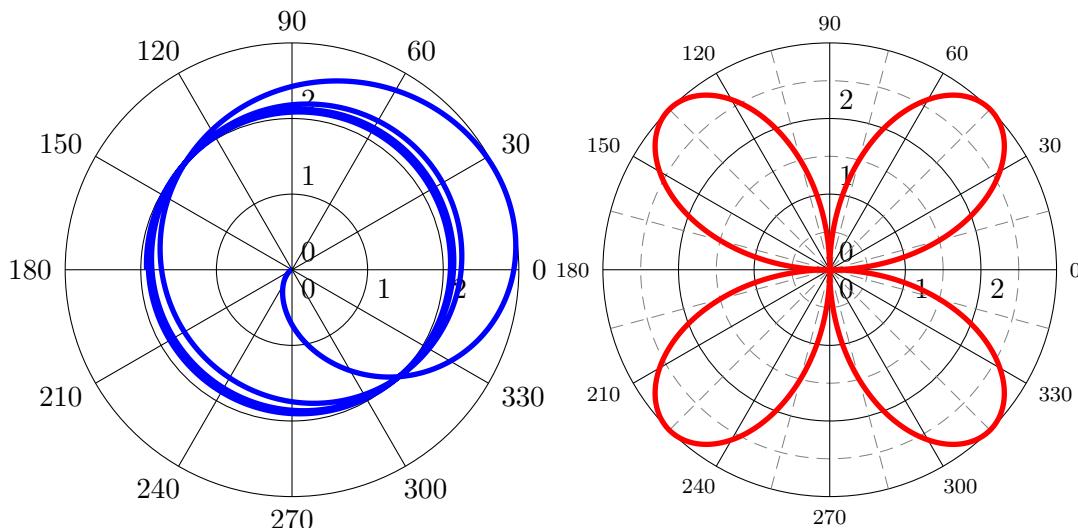

All valid optional arguments for the axes are also possible for the polar style, if they make sense ... :-) Important are the Dy option, it defines the angle interval and subticks, for the intermediate circles and lines. The number can be different for the circles (ysubticks) and the lines (xsubticks).

```
\begin{pspicture}(-3,-1)(4.5,4.5)
\psaxes[axesstyle=polar,
subticklinestyle=dashed,
subticks=2,Dy=20,Oy=20,
ylabelFactor=\circ(4,140)
\psline[linewidth=2pt]{->}(4;15)
\psline[linewidth=2pt]{->}(2;40)
\psline{->}(2;10)(3;85)
\end{pspicture}
```

```
\begin{pspicture}(-3.5,-3.5)(3.5,3.5)
\psaxes[axesstyle=polar](3,0)
\psplot[polarplot,algebraic,linecolor=blue,linewidth=2pt,
plotpoints=2000]{0}{TwoPi}{4 mul}{2*(sin(x)-x)/(cos(x)+x)}
\end{pspicture}
%
\begin{pspicture}(-3.5,-3.5)(3.5,3.5)
\psaxes[axesstyle=polar,subticklinestyle=dashed,subticks=2,
 xlabelFontSize=\scriptstyle](3,360)
\psplot[polarplot,algebraic,linecolor=red,linewidth=2pt,
plotpoints=2000]{0}{TwoPi}{6*sin(x)*cos(x)}
\end{pspicture}
```

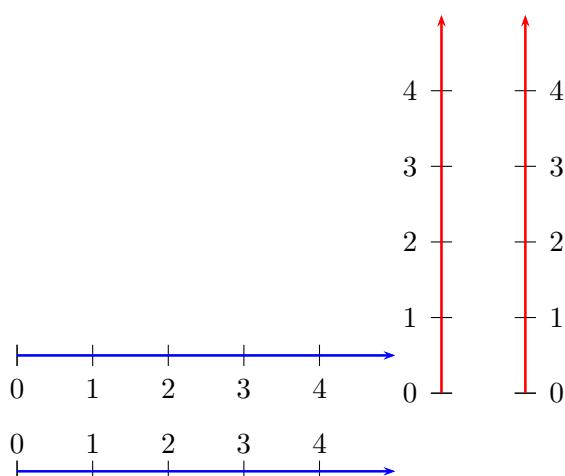

9.7. Option `xyAxes`, `xAxis` and `yAxis`

Syntax:

```
xyAxes=true|false
xAxis=true|false
yAxis=true|false
```

Sometimes there is only a need for one axis with ticks. In this case you can set one of the preceding options to false. The `xyAxes` only makes sense when you want to set both `x` and `y` to true with only one command, back to the default, because with `xyAxes=false` you get nothing with the `\psaxes` macro.

```
\begin{pspicture}(5,1)
\psaxes[yAxis=false, linecolor=blue]{->}(0,0.5)(5,0.5)
\end{pspicture}
\begin{pspicture}(1,5)
\psaxes[xAxis=false, linecolor=red]{->}(0.5,0)(0.5,5)
\end{pspicture}
\begin{pspicture}(1,5)
\psaxes[xAxis=false, linecolor=red,
ylabelPos=right]{->}(0.5,0)(0.5,5)
\end{pspicture}\relax[0.5cm]
\begin{pspicture}(5,1)
\psaxes[yAxis=false, linecolor=blue,
 xlabelPos=top]{->}(0,0.5)(5,0.5)
\end{pspicture}
```

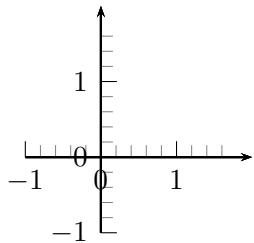

As seen in the example, a single `y` axis gets the labels on the left side. This can be changed with the option `ylabelPos` or with `xlabelPos` for the `x`-axis.

9.8. Option `labels`

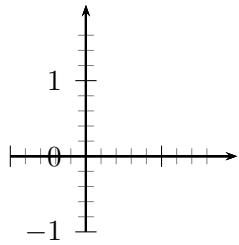

Syntax:

```
labels=all|x|y|none
```

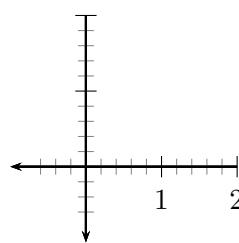

This option was already in the `pst-plot` package and only mentioned here for completeness.

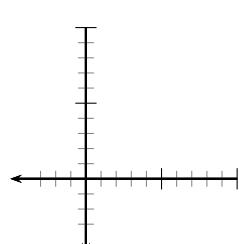

```
\psset{ticksize=6pt}
\begin{pspicture}(-1,-1)(2,2)
\psaxes[labels=all,subticks=5]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[labels=y,subticks=5]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[labels=x,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

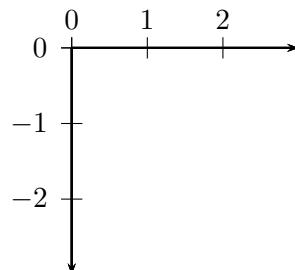

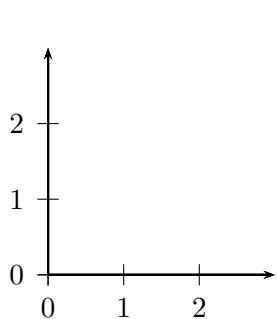

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[labels=none,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

9.9. Options `xlabelPos` and `ylabelPos`

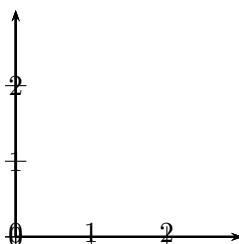

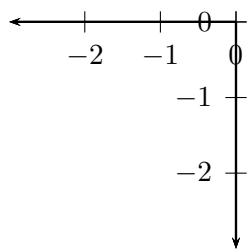

Syntax:

```
xlabelPos=bottom|axis|top
ylabelPos=left|axis|right
```

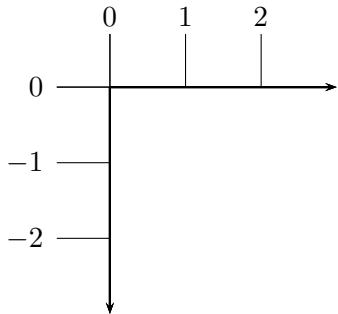

By default the labels for ticks are placed at the bottom (x axis) and left (y-axis). If both axes are drawn in the negative direction the default is top (x axis) and right (y axis). It can be changed with the two options `xlabelPos` and `ylabelPos`. With the value `axis` the user can place the labels depending on the value of `labelsep`, which is taken into account for `axis`.

```
\begin{pspicture}(3,3)
\psaxes{->}(3,3)
\end{pspicture}\hspace{2cm}
\begin{pspicture}(3,-3)
\psaxes[xlabelPos=top]{->}(3,-3)
\end{pspicture}
```

```
\begin{pspicture}(-3,-3)
\psaxes{->}(-3,-3)
\end{pspicture}\hspace{2cm}
\begin{pspicture}(3,3)
\psaxes[labelsep=0pt,
ylabelPos=axis,
xlabelPos=axis]{->}(3,3)
\end{pspicture}
```

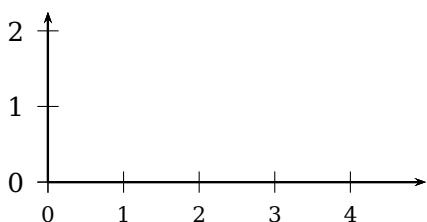

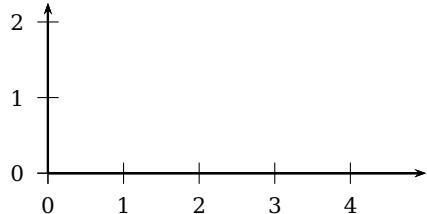

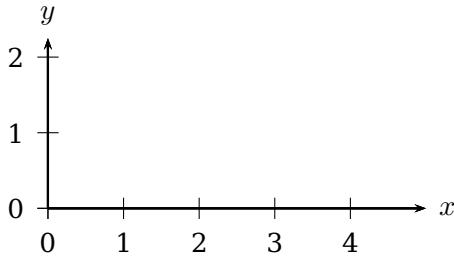

```
\begin{pspicture}(-1,1)(3,-3)
\psaxes[xlabelPos=top,
xticksize=0 20pt,
yticksize=-20pt 0]{->}(3,-3)
\end{pspicture}
```

9.10. Options `x|ylabelFontSize` and `x|ymathLabel`

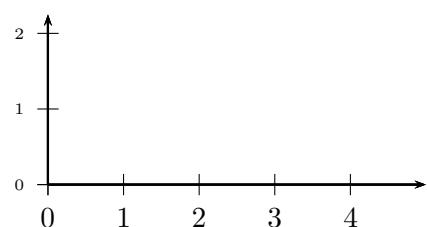

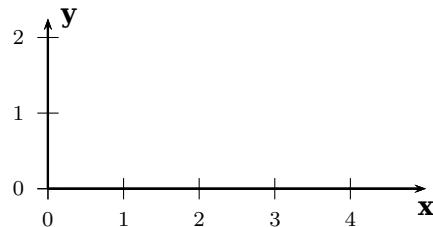

This option sets the horizontal **and** vertical font size for the labels depending on the option `mathLabel` (`xmathLabel`/`ymathLabel`) for the text or the math mode. It will be overwritten when another package or a user defines

```
\def\pshlabel#1{\ xlabelFontSize ...}
\def\psvlabel#1{\ ylabelFontSize ...}
\def\pshlabel#1{$\ xlabelFontSize ...$}% for mathLabel=true (default)
\def\psvlabel#1{$\ ylabelFontSize ...$}% for mathLabel=true (default)
```

in another way. Note that for `mathLabel=true` the font size must be set by one of the mathematical styles `\textstyle`, `\displaystyle`, `\scriptstyle`, or `\scriptscriptstyle`.

```
\psset{mathLabel=false}
\begin{pspicture}(-0.25,-0.25)(5,2.25)
\psaxes{->}(5,2.25)[x$,0][$y$,90]
\end{pspicture}\[20pt]
\begin{pspicture}(-0.25,-0.25)(5,2.25)
\psaxes[labelFontSize=\footnotesize]{->}(5,2.25)
\end{pspicture}\[20pt]
\begin{pspicture}(-0.25,-0.25)(5,2.25)
\psaxes[xlabelFontSize=\footnotesize]{->}(5,2.25)
\end{pspicture}\[20pt]
```

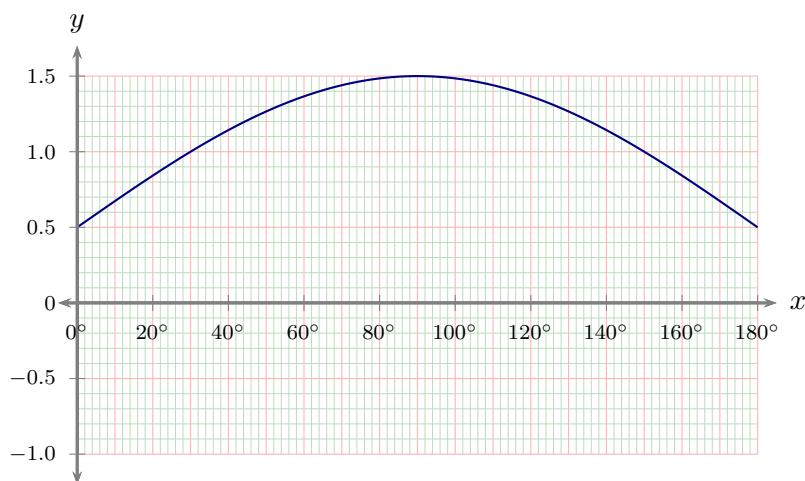

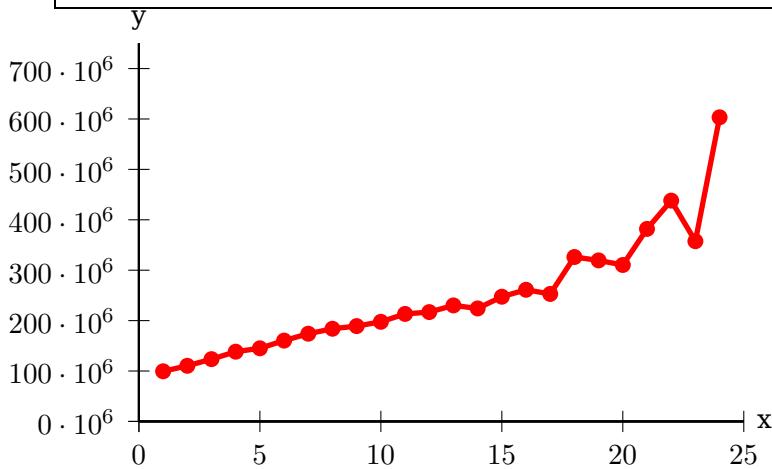

```
\begin{pspicture}(-0.25,-0.25)(5,2.25)
\psaxes[labelFontSize=\scriptstyle]{->}(5,2.25)[\textbf{x},-90][\textbf{y},0]
\end{pspicture}\[20pt]
\psset{mathLabel=true}
\begin{pspicture}(-0.25,-0.25)(5,2.25)
\psaxes[ylabelFontSize=\scriptscriptstyle]{->}(5,2.25)
\end{pspicture}\[20pt]
```

9.11. Options xlabelFactor and ylabelFactor

When having big numbers as data records then it makes sense to write the values as $<\textit{number}> \cdot 10^{<\textit{exp}>}$. These new options allow you to define the additional part of the value, but it must be set in math mode when using math operators or macros like `\cdot`!

```
\readdata{\data}{data/demo1.data}
\pstScalePoints(1,0.000001){}{% (x,y){additional x operator}{y op}
\psset{llx=-1cm, lly=-1cm}
\psgraph[ylabelFactor=\cdot 10^6,Dx=5,Dy=100](0,0)(25,750){8cm}{5cm}
  \listplot[linecolor=red, linewidth=2pt, showpoints=true]{\data}
\endpsgraph
\pstScalePoints(1,1){}{% reset
```

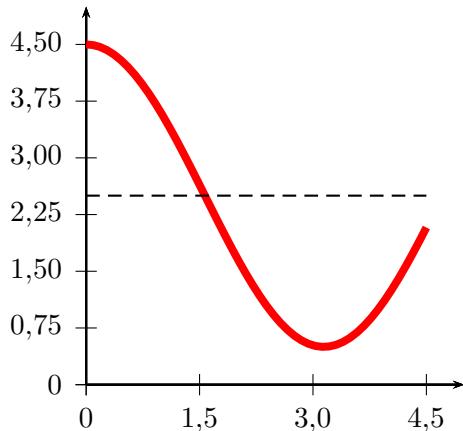

```
\psset{xunit=0.05, yunit=2,labelFontSize=\scriptstyle,algebraic,plotpoints=500}
\newpsstyle{mygrid}{%
  Dx=10,Dy=0.5,labels=none,subticks=5,tickwidth=0.4pt,subtickwidth=0.2pt,
  tickcolor=Red!30,subtickcolor=ForestGreen!30,
  xticksize=-1 1.5,yticksize=0 180,subticksize=1}
\begin{pspicture}(-10,-1.3)(190,1.8)
  \psaxes[style=mygrid](0,0)(0,-1)(180,1.51)
  \psplot[linecolor=NavyBlue]{0}{180}{sin(x*Pi/180)+1/2}
  \psaxes[Dx=20,Dy=0.5,linecolor=gray,tickcolor=gray,linewidth=1pt,ticks=-3pt 3pt,
    xlabelFactor={}\circ{}(->)(0,0)(-5,-1.2)(185,1.7)[x$,0][y$,90]
\end{pspicture}
```

9.12. Options decimalSeparator and comma

Syntax:

```
comma=false|true
decimalSeparator=<character>
```

Setting the option `comma` to true gives labels with a comma as a decimal separator instead of the default dot. `comma` and `comma=true` is the same. The optional argument `decimalSeparator` allows an individual setting for languages with a different character than a dot or a comma. The character has to be set into braces, if it is an active one, e.g. `decimalSeparator={,}`.

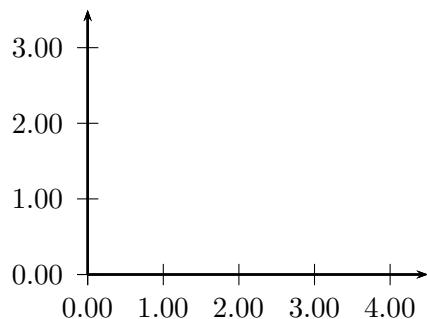

```
\begin{pspicture}(-0.5,-0.5)(5,5.5)
\psaxes[Dx=1.5,comma,Dy=0.75,dy=0.75]{->}(5,5)
\psplot[linecolor=red,linewidth=3pt]{0}{4.5}{x RadtoDeg cos 2 mul 2.5 add}
\psline[linestyle=dashed](0,2.25)(4.5,2.25)
\end{pspicture}
```

9.13. Options xyDecimals, xDecimals and yDecimals

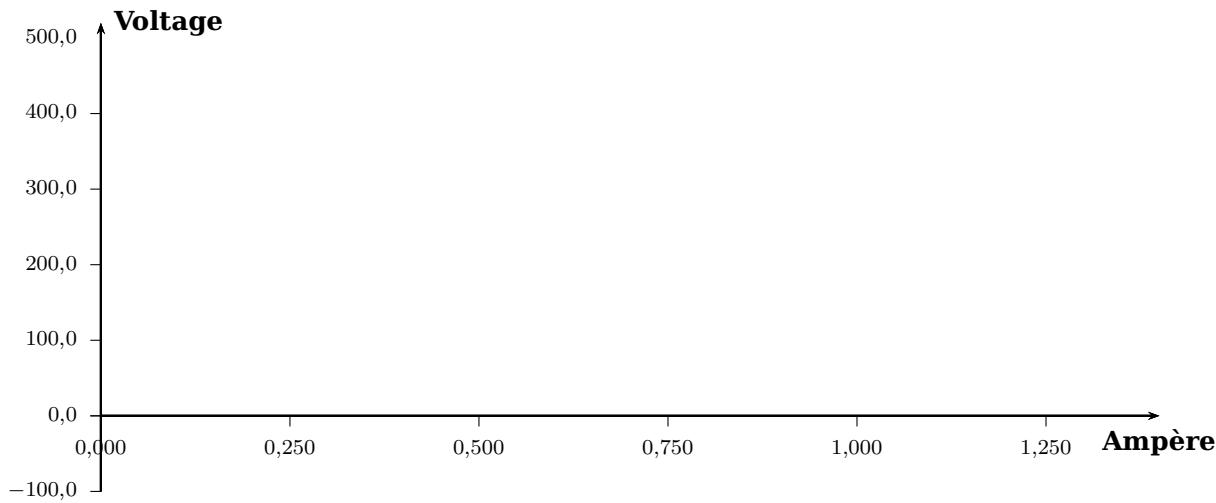

Syntax:

```
xyDecimals=<number>
xDecimals=<any>
yDecimals=<any>
```

By default the labels of the axes get numbers with or without decimals, depending on the numbers itself. With these options it is possible to determine the decimals, where the option `xyDecimals` sets this identical for both axes. `xDecimals` only for the `x` and `yDecimals` only for the `y` axis. The default setting `{}` means, that you'll get the standard behaviour.

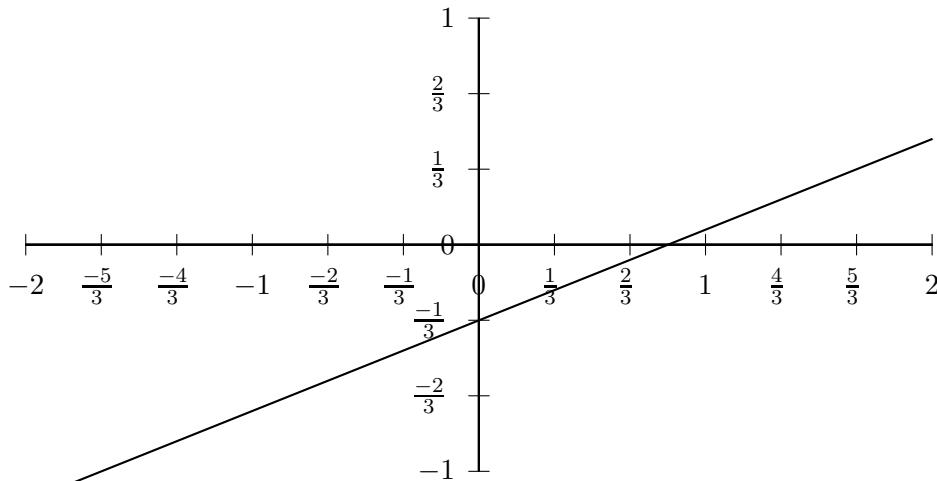

```
\begin{pspicture}(-1.5,-0.5)(5,3.75)
\psaxes[xyDecimals=2]{->}(0,0)(4.5,3.5)
\end{pspicture}
```

```
\psset{xunit=10cm,yunit=0.01cm,labelFontSize=\scriptstyle}
\begin{pspicture}(-0.1,-150)(1.5,550.0)
\psaxes[Dx=0.25,Dy=100,ticksize=-4pt 0,comma,xDecimals=3,yDecimals=1]{->}%
(0,0)(0,-100)(1.4,520)[\textbf{Amp\`ere},-90][\textbf{Voltage},0]
\end{pspicture}
```

9.14. Options `fractionLabels`, `xfractionLabels`, `yfractionLabels`, `fractionLabelBase`, `xfractionLabelBase`, and `yfractionLabelBase`

With the option `fractionLabels=true` the labels on the axes are set as fractions. The option `fractionLabelBase` sets the denominator of fraction. The default value of 0 is the same as no fraction.

```
\psset{fractionLabels,fractionLabelBase=3,unit=3cm}
\begin{pspicture}(-2,-1)(2,1)
\psaxes[dx=0.333,dy=0.333](0,0)(-2,-1)(2,1)
\psplot[algebraic,plotpoints=100]{-2}{2}{0.4*x-1/3}
\end{pspicture}
```

9.15. Options `trigLabels`, `xtrigLabels`, `ytrigLabels`, `trigLabelBase`, `xtrigLabelBase`, and `ytrigLabelBase` for an axis with trigonometrical units

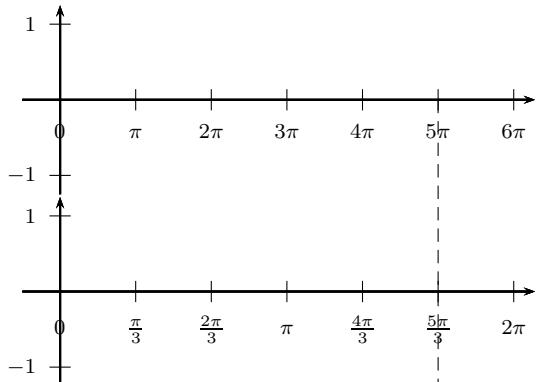

With the option `trigLabels=true` *only* the labels on the x axis are trigonometrical ones. It is the same than setting `xtrigLabels=true`. The option `trigLabelBase` sets the denominator of fraction. The default value of 0 is the same as no fraction. The following constants are defined in the package:

```
\def\psPiFour{12.566371}
\def\psPiTwo{6.283185}
\def\psPi{3.14159265}
\def\psPiH{1.570796327}
\newdimen\pstRadUnit
\newdimen\pstRadUnitInv
\pstRadUnit=1.047198cm % this is pi/3
\pstRadUnitInv=0.95493cm % this is 3/pi
```

Because it is a bit complicated to set the right values, we show some more examples here. For **all** following examples in this section we did a global

```
\psset{trigLabels,labelFontSize=\scriptstyle}
```

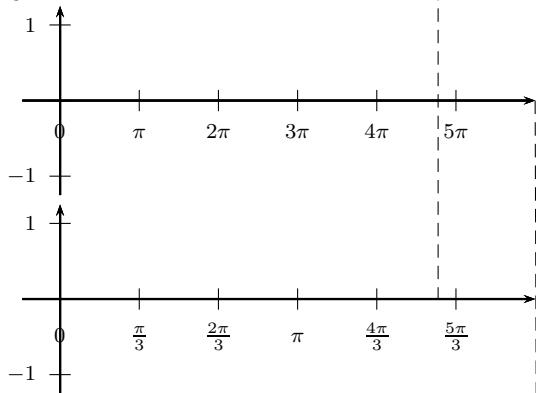

Translating the decimal ticks to trigonometrical ones makes no real sense, because every 1 xunit (1cm) is a tick and the last one is at 6cm.

```
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\pnode(5,0){A}%
\psaxes{->}(0,0)(-.5,-1.25)(\psPiTwo,1.25)
\end{pspicture}
```

```
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)
(\psPiTwo,1.25)
\end{pspicture}
```

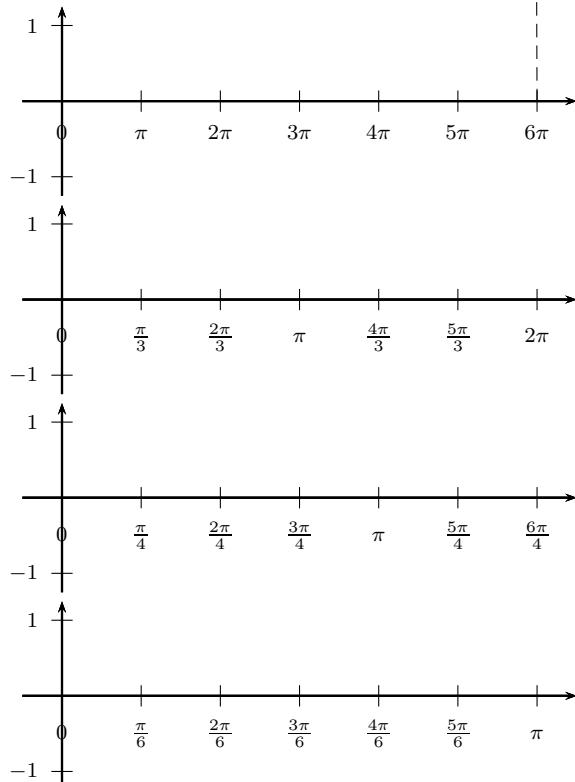

Modifying the ticks to have the last one exactly at the end is possible with a different dx value ($\frac{\pi}{3} \approx 1.047$):

```
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode(\psPiTwo,0){C}%
\psaxes[dx=\pstRadUnit]{->}(0,0)(-0.5,-1.25)(\psPiTwo,1.25)
\end{pspicture}
```

```
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode(5,0){B}%
\psaxes[dx=\pstRadUnit,trigLabelBase=3]{->}(0,0)(-0.5,-1.25)(\psPiTwo,1.25)
\end{pspicture}
```

Set everything globally in radian units. Now 6 units on the x -axis are 6π . Using `trigLabelBase=3` reduces this value to 2π , a.s.o.

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)\pnode(6,0){D}%
\psaxes{->}(0,0)(-0.5,-1.25)(6.5,1.25)%
\end{pspicture}
```

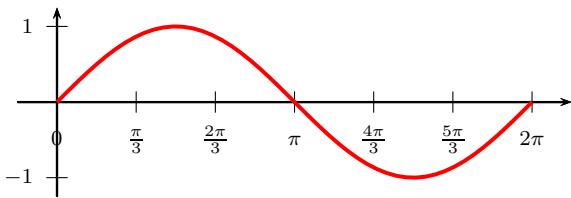

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
\end{pspicture}
```

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=4]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
\end{pspicture}
```

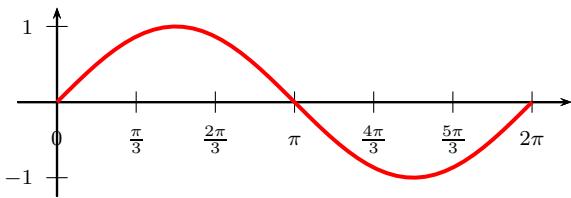

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=6]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
\end{pspicture}
```

The best way seems to be to set the x -unit to `\pstRadUnit`. Plotting a function doesn't consider the value for `trigLabelBase`, it has to be done by the user. The first example sets the unit locally

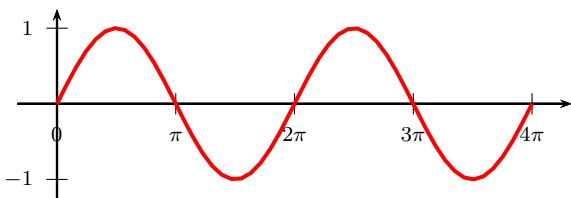

for the `\psplot` back to 1cm, which is needed, because we use this unit on the PostScript side.

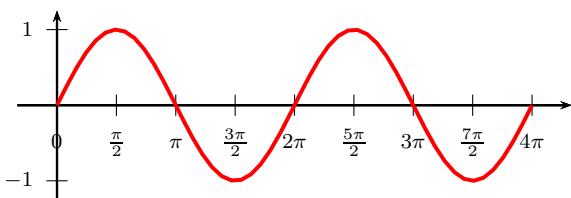

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)
(6.5,1.25)
\psplot[xunit=1cm, linecolor=red, linewidth=1.5pt]{0}{\psPiTwo}{x RadtoDeg sin}
\end{pspicture}
```

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[trigLabelBase=3]{->}(0,0)(-0.5,-1.25)
(6.5,1.25)
\psplot[linecolor=red, linewidth=1.5pt]{0}{6}{x Pi 3 div mul RadtoDeg sin}
\end{pspicture}
```

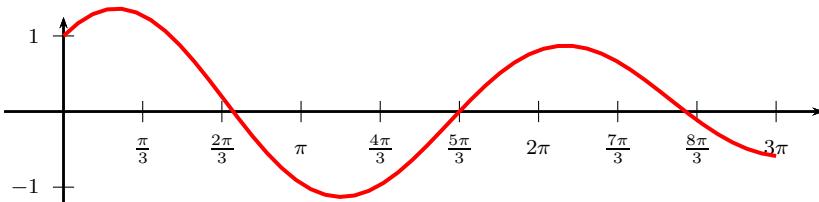

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[dx=1.5]{->}(0,0)(-0.5,-1.25)(6.5,1.25)
\psplot[xunit=0.5cm, linecolor=red, linewidth=1.5pt]{0}{\psPiFour}{x RadtoDeg sin}
\end{pspicture}
```

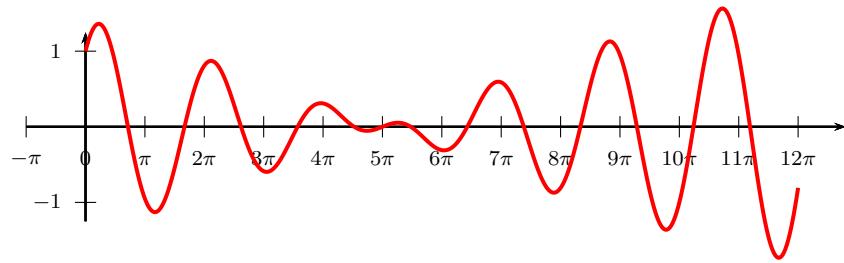

```
\psset{xunit=\pstRadUnit}%
\begin{pspicture}(-0.5,-1.25)(6.5,1.25)
\psaxes[dx=0.75, trigLabelBase=2]{->}(0,0)
(-0.5,-1.25)(6.5,1.25)
\psplot[xunit=0.5cm, linecolor=red, linewidth=1.5pt]{0}{\psPiFour}{x RadtoDeg sin}
\end{pspicture}
```

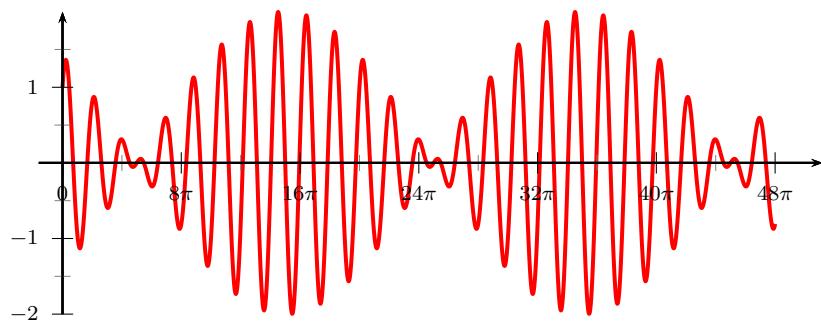

It is also possible to set the x unit and dx value to get the labels right. But this needs some more understanding as to how it really works. A `xunit=1.570796327` sets the unit to $\pi/2$ and a `dx=0.666667` then puts at every $2/3$ of the unit a tick mark and a label. The length of the x -axis is 6.4 units which is $6.4 \cdot 1.570796327 \text{ cm} \approx 10 \text{ cm}$. The function then is plotted from 0 to $3\pi = 9.424777961$.

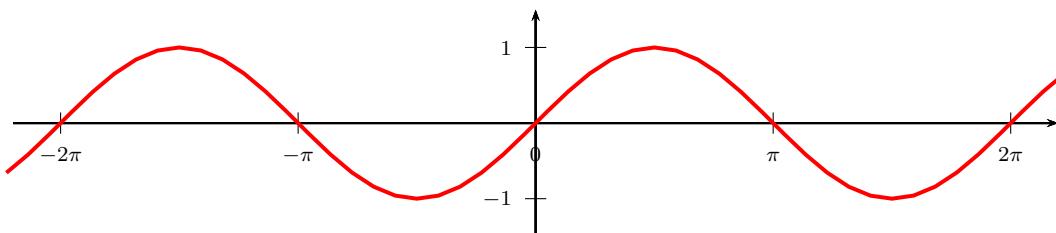

```
\begin{pspicture}(-0.5,-1.25)(10,1.25)
\psaxes[xunit=\psPiH, trigLabelBase=3, dx=0.666667]{->}(0,0)(-0.5,-1.25)(6.4,1.25)
\psplot[linecolor=red, linewidth=1.5pt]{0}{9.424777961}{%
x RadtoDeg dup sin exch 1.1 mul cos add}
\end{pspicture}
```

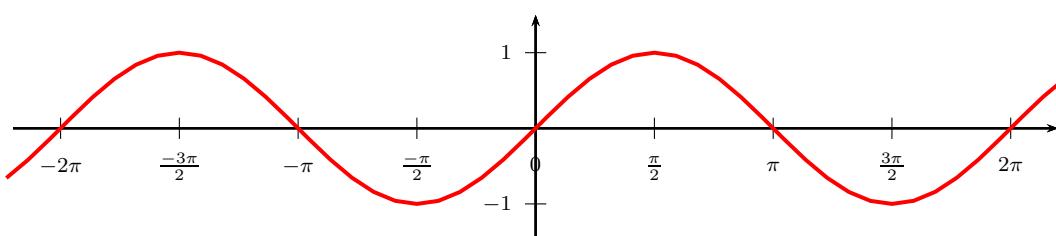

```
\psset{unit=1cm}
\psplot[xunit=0.25,plotpoints=500,linecolor=red,linewidth=1.5pt]{0}{37.70}{%
x RadtoDeg dup sin exch 1.1 mul cos add}
\end{pspicture}
```

```
\psset{unit=1cm}
\begin{pspicture}(-0.5,-1.25)(10,1.25)
\psplot[xunit=0.0625,linecolor=red,linewidth=1.5pt,%
plotpoints=5000]{0}{150.80}{%
{x RadtoDeg dup sin exch 1.1 mul cos add}
\psaxes[xunit=\psPi, dx=0.5, Dx=8]{->}(0,0)(-0.25,-1.25)(3.2,1.25)
\end{pspicture}
```

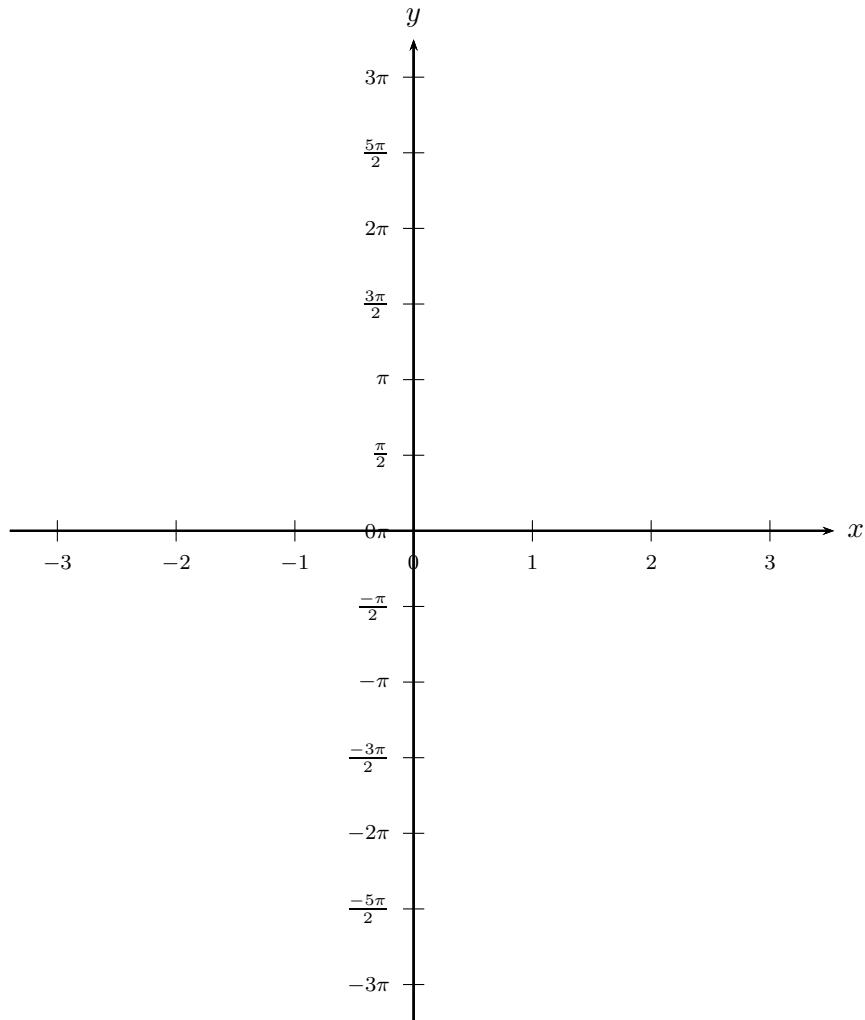

```
\begin{pspicture}(-7,-1.5)(7,1.5)
\psaxes[trigLabels=true,xunit=\psPi]{->}(0,0)(-2.2,-1.5)(2.2,1.5)
\psplot[linecolor=red,linewidth=1.5pt]{-7}{7}{x RadtoDeg sin}
\end{pspicture}
```

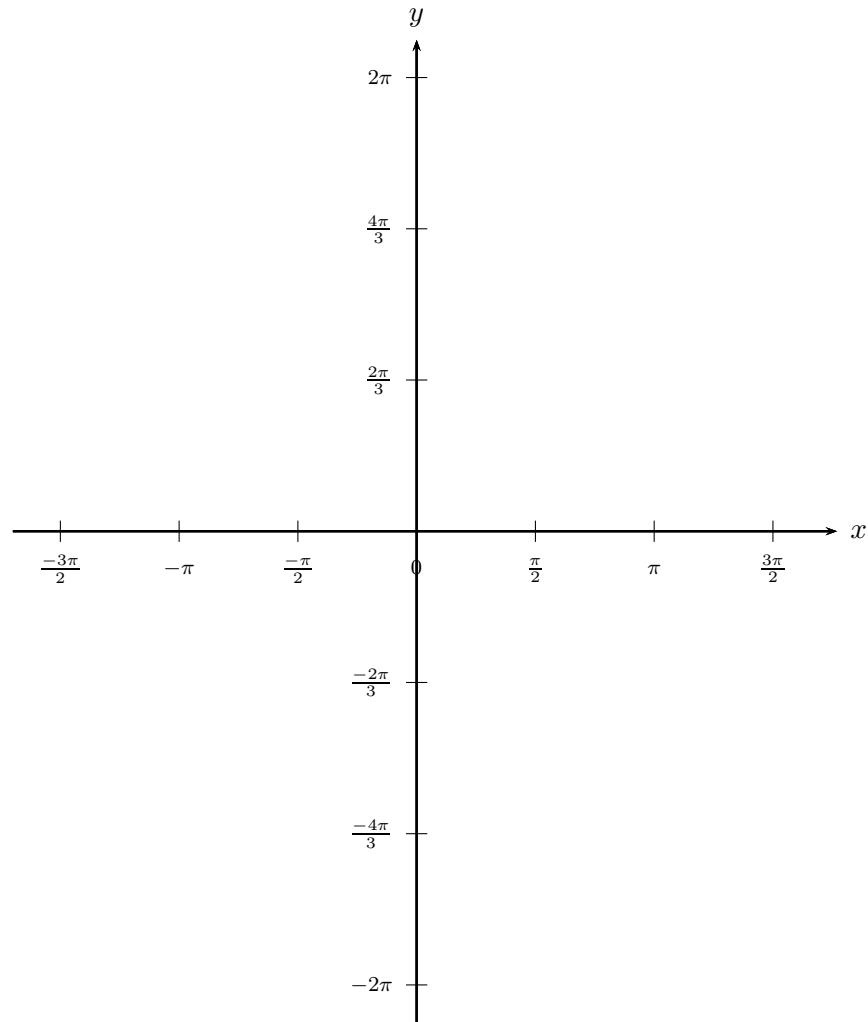

```
\begin{pspicture}(-7,-1.5)(7,1.5)
\psaxes[trigLabels=true,
trigLabelBase=2,dx=\psPiH,xunit=\psPi]{->}(0,0)(-2.2,-1.5)(2.2,1.5)
\psplot[linecolor=red,linewidth=1.5pt]{-7}{7}{x RadtoDeg sin}
\end{pspicture}
```

The setting of trigonometrical labels with `ytrigLabels=true` for the y axis is the same as for the x axis.

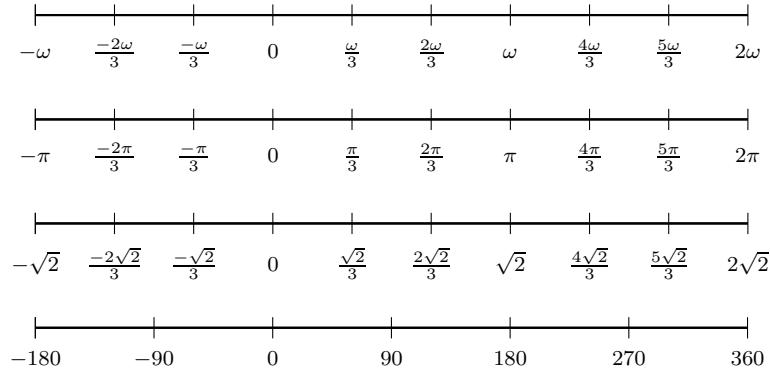

```
\psset{unit=1cm}
\begin{pspicture}(-6.5,-7)(6.5,7.5)
\psaxes[trigLabelBase=2,dx=\psPiH,xunit=\psPi,ytrigLabels]
{->}(0,0)(-1.7,-6.5)(1.77,6.5)[\$x\$,0][\$y\$,90]
\end{pspicture}
```

Also setting labels for the x axis is possible with `trigLabels=true` or alternatively with `ytrigLabels=true`

```
\psset{unit=1cm}
\begin{pspicture}(-6.5,-7)(6.5,7.5)
\psaxes[trigLabels,xtrigLabelBase=2,ytrigLabelBase=3,dx=\psPiH,
        xunit=\psPi,Dy=2]{->}(0,0)(-1.7,-6.5)(1.77,6.5)[x$,0][y$,90]
\end{pspicture}
```

```
\begin{pspicture}(-\psPi,-5mm)(\psPiTwo,12pt)
\def\pi{\omega}% Hold it local
\psaxes[dx=\pstRadUnit,0x=-3](-\psPi,-12pt)(\psPiTwo,12pt)
\end{pspicture}

\bigskip
\begin{pspicture}(-\psPi,-5mm)(\psPiTwo,12pt)
\psaxes[dx=\pstRadUnit,0x=-3](-\psPi,-12pt)(\psPiTwo,12pt)
\end{pspicture}

\bigskip
\begin{pspicture}(-\psPi,-5mm)(\psPiTwo,12pt)
\def\pi{\sqrt{2}}% Hold it local
\psaxes[dx=\pstRadUnit,0x=-3](-\psPi,-12pt)(\psPiTwo,12pt)
\end{pspicture}

\bigskip
\psset{trigLabels=false}
\begin{pspicture}(-\psPi,-10mm)(\psPiTwo,12pt)
\psaxes[dx=\pscalculate{3.14/2},Dx=90,0x=-180](-\psPi,-12pt)(\psPiTwo,12pt)
\end{pspicture}
```

9.16. Option ticks

Syntax:

```
ticks=all|x|y|none
```

This option was already in the `pst-plot` package and only mentioned here for some completeness.

```
\psset{ticksize=6pt}
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=all,subticks=5]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=y,subticks=5]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=x,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

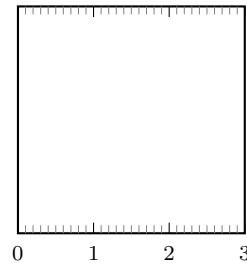

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=none,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

9.17. Option `tickstyle`

Syntax:

```
tickstyle=full|top|bottom|inner
```

The value `inner` is only possible for the axes style `frame`.

```
\psset{subticks=10}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=full]{->}(3,3) \end{pspicture}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=top]{->}(3,3) \end{pspicture}
\begin{pspicture}(-1,-1)(3,3) \psaxes[tickstyle=bottom]{->}(3,3)\end{pspicture}
\begin{pspicture}(-1,-1)(3,3)
  \psaxes[axesstyle=frame, tickstyle=inner, ticksize=0 4pt]{->}(3,3)
\end{pspicture}
```

9.18. Options `ticksize`, `xticks`, `ytics`

With this new option the recent `tickstyle` option of `psplot` is obsolete and no longer supported by `pstricks-add`.

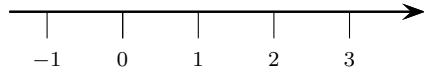

Syntax:

```
ticksize=value[unit]
ticksize=value[unit] value[unit]
xticks=value[unit]
xticks=value[unit] value[unit]
yticks=value[unit]
yticks=value[unit] value[unit]
```

`ticksize` sets both values. The first one is left/below and the optional second one is right/above of the coordinate axis. The old setting `tickstyle=bottom` is now easy to realize, e.g.: `ticksize=-6pt 0`, or vice versa, if the coordinates are set from positive to negative values.

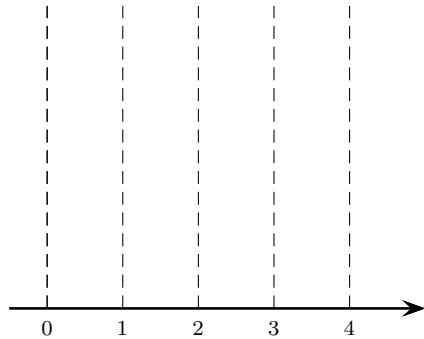

```
\psset{arrowscale=2}
\begin{pspicture}(-1.5,-1.5)(4,3.5)
  \psaxes[ticksize=0.5cm]{->}(0,0)(-1.5,-1.5)(4,3.5)
\end{pspicture}
```

```
\psset{arrowscale=2}
\begin{pspicture}(-1.5,-1.5)(4,3.5)
\psaxes[xticksize=-10pt 0,yticksize=0 10pt]{->}(0,0)(-1.5,-1.5)(4,3.5)
\end{pspicture}
```

A grid is also possible by setting the values to the max/min coordinates.

```
\psset{arrowscale=2}
\begin{pspicture}(-.5,-.5)(5,4.5)
\psaxes[ticklinestyle=dashed,
       ticksize=0 4cm]{->}(0,0)(-.5,-.5)(5,4.5)
\end{pspicture}
```

9.19. Options subticks, xsubticks, and ysubticks

Syntax:

```
subticks=<number>
xsubticks=<number>
ysubticks=<number>
```

By default subticks cannot have labels.

```
\psset{ticksize=6pt}
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=all,xsubticks=5,
        ysubticks=10]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=y,subticks=5]{->}(0,0)(-1,-1)(2,2)
\end{pspicture}
```

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=x,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

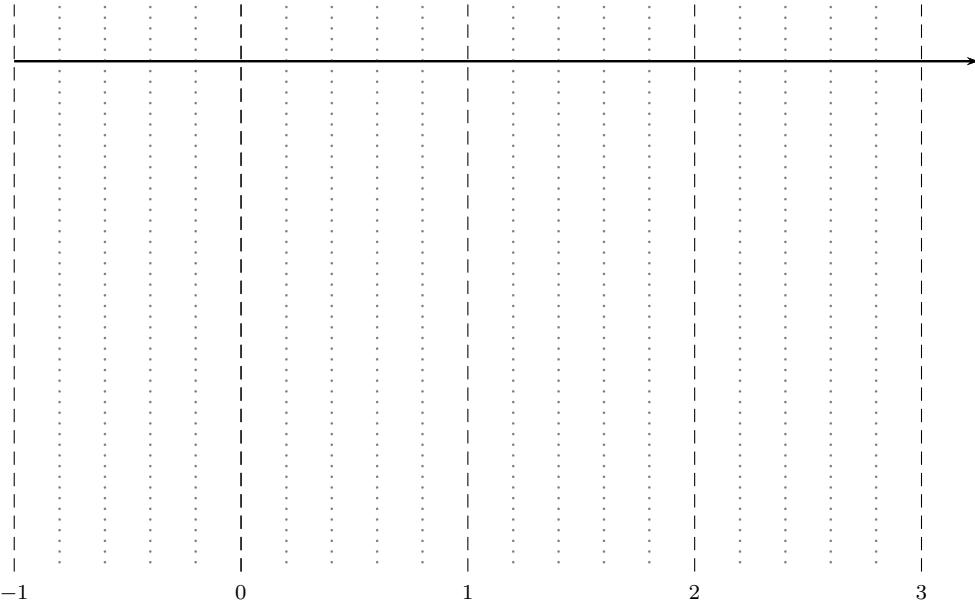

```
\begin{pspicture}(-1,-1)(2,2)
\psaxes[ticks=none,subticks=5]{->}(0,0)(2,2)(-1,-1)
\end{pspicture}
```

9.20. Options subticksize, xsubticksize, ysubticksize

subticksize sets both values, xsubticksize only for the *x*-axis and ysubticksize only for the *y*-axis, which must be relative to the ticksize length and can have any number. 1 sets it to the same length as the main ticks.

Syntax:

```
subticksize=value
xsubticksize=value
ysubticksize=value
```

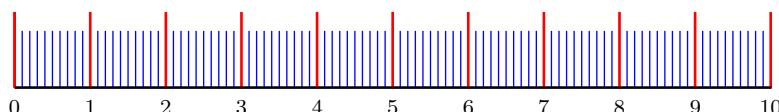

```
\psset{yunit=1.5cm,xunit=3cm}
\begin{pspicture}(-1.25,-4.75)(3.25,.75)
\psaxes[xticksize=-4.5 0.5,ticklinestyle=dashed,subticks=5,xsubticksize=1,%%
ysubticksize=0.75,xsubticklinestyle=dotted,xsubtickwidth=1pt,
subtickcolor=gray]{->}(0,0)(-1,-4)(3.25,0.5)
\end{pspicture}
```

9.21. Options **tickcolor**, **x tickcolor**, **y tickcolor**, **sub tickcolor**, **x sub tickcolor**, and **y sub tickcolor**

Syntax:

```
tickcolor=<color>
x tickcolor=<color>
y tickcolor=<color>
sub tickcolor=<color>
x sub tickcolor=<color>
y sub tickcolor=<color>
```

tickcolor and **sub tickcolor** set both for the *x*- and the *y*-Axis.

```
\begin{pspicture}(0,-0.75)(10,1)
\psaxes[yAxis=false,labelFontSize=\scriptstyle,ticksize=0 10mm,subticks=10,subticksize
=0.75,
tickcolor=red,sub tickcolor=blue,tickwidth=1pt,sub tickwidth=0.5pt](10.01,0)
\end{pspicture}
```

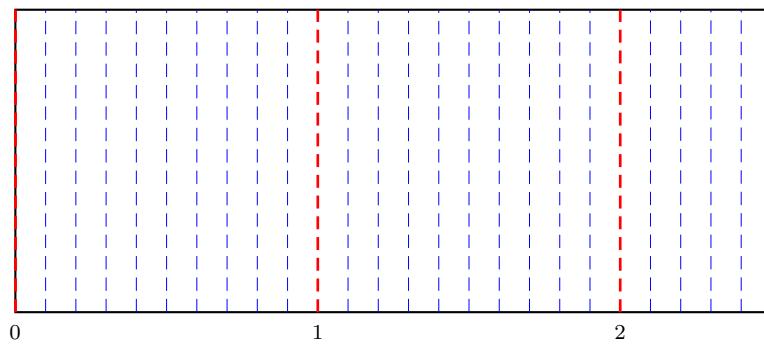

```
\begin{pspicture}(5,-0.75)(10,1)
\psaxes[yAxis=false,labelFontSize=\scriptstyle,ticksize=0 -10mm
,subticks=10,subticksize=0.75,
tickcolor=red,subtickcolor=blue,tickwidth=1pt,subtickwidth=0.5
pt,0x=5](5,0)(5,0)(10.01,0)
\end{pspicture}
```

9.22. Options `ticklinestyle`, `x ticklinestyle`, `y ticklinestyle`, `sub ticklinestyle`, `x sub ticklinestyle`, and `y sub ticklinestyle`

Syntax:

```
ticklinestyle=solid|dashed|dotted|none
x ticklinestyle=solid|dashed|dotted|none
y ticklinestyle=solid|dashed|dotted|none
sub ticklinestyle=solid|dashed|dotted|none
x sub ticklinestyle=solid|dashed|dotted|none
y sub ticklinestyle=solid|dashed|dotted|none
```

`ticklinestyle` and `sub ticklinestyle` set both values for the x and y axis. The value `none` doesn't really make sense, because it is the same as `[sub] ticklines=0`

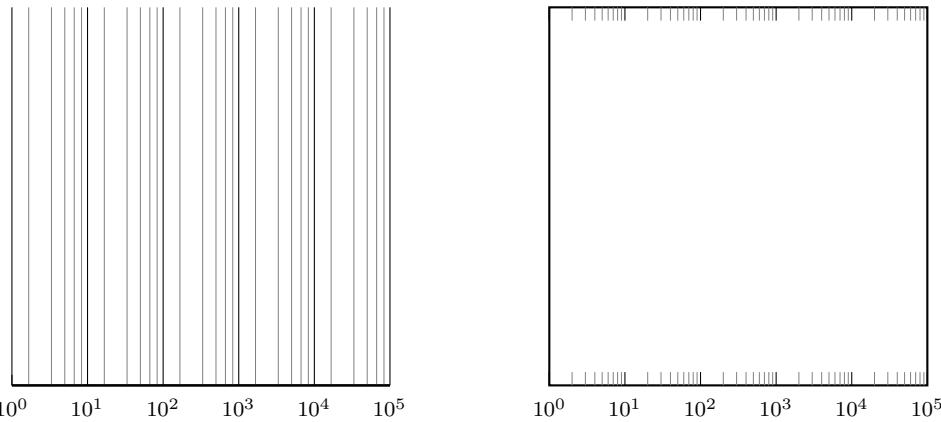

```
\psset{unit=4cm}
\pspicture(-0.15,-0.15)(2.5,1)
\psaxes[axesstyle=frame,logLines=y,x ticksize=0 1,xsub ticksize=1,y logBase=10,
tickcolor=red,sub tickcolor=blue,tickwidth=1pt,subticks=9,xsubticks=10,
x ticklinestyle=dashed,xsub ticklinestyle=dashed](2.5,1)
\endpspicture
```

9.23. `logLines`

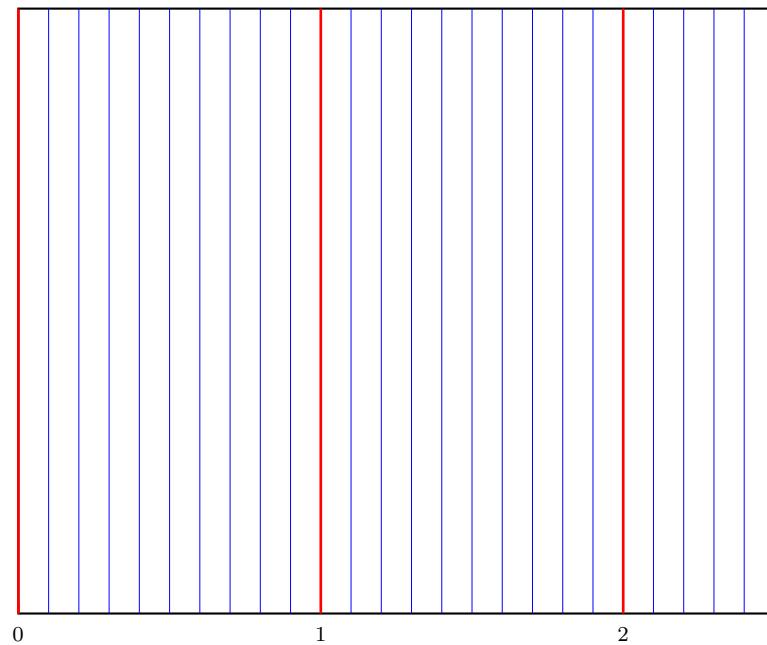

Syntax:

```
logLines=all|x|y
```

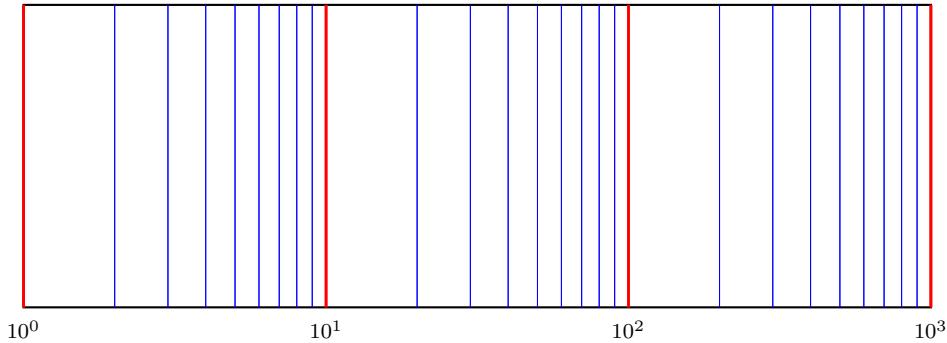

By default the option `logLines` sets the `ticksize` to the maximal length for x, y, or both. It can be changed, when after the option `logLines` the `ticksize` is set.

```
\pspicture(-1,-1)(5,5)
  \psaxes[subticks=5,xylogBase=10,logLines=all](5,5)
\endpspicture\hspace{1cm}
\pspicture(-1,-1)(5,5)
  \psaxes[subticks=9,axesstyle=frame,xylogBase=10,logLines=all,
    ticksize=0 5pt,tickstyle=inner](5,5)
\endpspicture
```

```
\psset{unit=4cm}
\pspicture(-0.15,-0.15)(2.5,2)
  \psaxes[axesstyle=frame,logLines=y,xTicksize=max,xsubTicksize=1,ylogBase=10,
    tickcolor=red,subtickcolor=blue,tickwidth=1pt,subticks=9,xsubticks=10](2.5,2)
\endpspicture
```

```
\psset{unit=4}
\pspicture(-0.5,-0.3)(3,1.2)
\psaxes[axesstyle=frame,tickstyle=inner,logLines=x,xlogBase=10,Dy=0.5,tickcolor=red,
subtickcolor=blue,tickwidth=1pt,ysubticks=5,xsubticks=9](3,1)
\endpspicture
```

9.24. **xylogBase**, **xlogBase** and **ylogBase**

There are additional options **xylogBase**, **xlogBase**, **ylogBase** to get one or both axes with logarithmic labels. For an interval of $[10^{-3} \dots 10^2]$ choose a PStricksinterval of $[-3,2]$. PStricksstakes 0 as the origin of this axes, which is wrong if we want to have a logarithmic axes. With the options **0y** and **0x** we can set the origin to -3 , so that the first label gets 10^{-3} . If this is not done by the user then **pst-plot** does it by default. An alternative is to set these parameters to empty values **0x={} , 0y={}**, in this case the package does nothing.

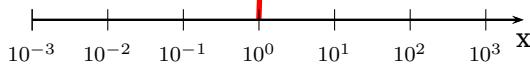

9.25. **xylogBase**

This mode in math is also called double logarithmic. It is a combination of the two foregoing modes and the function is now $y = \log x$ and is shown in the following example.

y

$$y = \log x$$

```
\begin{pspicture}(-3.5,-3.5)(3.5,3.5)
\psplot[linewidth=2pt, linecolor=red]{0.001}{3}{x log}
\psaxes[xylogBase=10,0y=-3,0x=-3]{->}(-3,-3)
(3.5,3.5)
\uput[-90](3.5,-3){x}
\uput[180](-3,3.5){y}
\rput(2.5,1){$y=\log x$}
\end{pspicture}
```

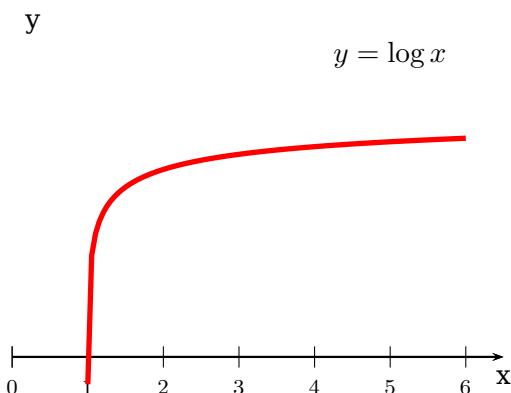

9.26. `ylogBase`

The values for the `\psaxes` y-coordinate are now the exponents to the base 10 and for the right function to the base e : $10^{-3} \dots 10^1$ which corresponds to the given y-interval $-3 \dots 1.5$, where only integers as exponents are possible. These logarithmic labels have no effect on the internally used units. To draw the logarithm function we have to use the math function

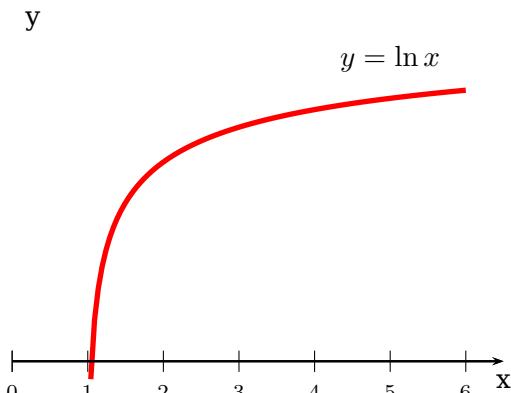

$$y = \log\{\log x\}$$

$$y = \ln\{\ln x\}$$

with an drawing interval of $1.001 \dots 6$.

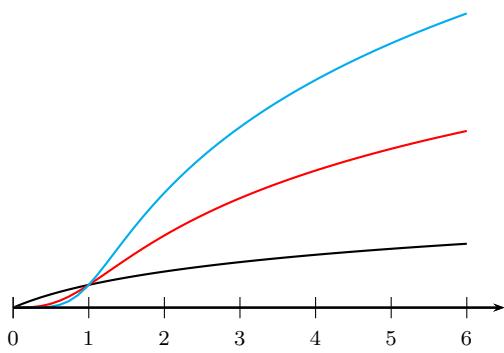

```
\begin{pspicture}(-0.5,-3.5)(6.5,1.5)
\psaxes[ylogBase=10,0y=-3]{->}(0,-3)(6.5,1.5)
\uput[-90](6.5,-3){x}
\uput[0](0,1.4){y}
\rput(5,1){$y=\log x$}
\psplot[linewidth=2pt,%
plotpoints=100,linecolor=red]{1.001}{6}{x log log}
\end{pspicture}
```

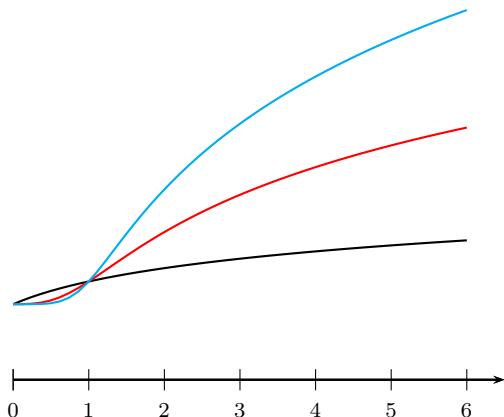

```
\begin{pspicture}(-0.5,-3.5)(6.5,1.5)
\psplot[linewidth=2pt,plotpoints=100,linecolor=red]{%
1.04}{6}{/ln {log 0.4343 div} def }{x ln ln} %
\psaxes[ylogBase=e,0y=-3]{->}(0,-3)(6.5,1.5)
\uput[-90](6.5,-3){x}
\uput[0](0,1.5){y}
\rput(5,1){$y=\ln x$}
\end{pspicture}
```

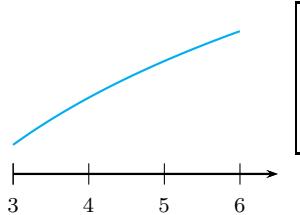

```
\begin{pspicture}(-0.5,1.75)(6.5,4.5)
\psaxes[ylogBase=10,0y=2]{->}(0,2)(0,2)(6.5,4.5)
\end{pspicture}
```

```
\begin{pspicture}(-0.5,-0.25)(6.5,4.5)
\psplot{0}{6}{x x cos add log} % x + cos(x)
\psplot[linecolor=red]{0}{6}{x 3 exp x cos add log}
% x^3 + cos(x)
\psplot[linecolor=cyan]{0}{6}{x 5 exp x cos add log}
% x^5 + cos(x)
\psaxes[ylogBase=10]{->}(6.5,4.5)
\end{pspicture}
```

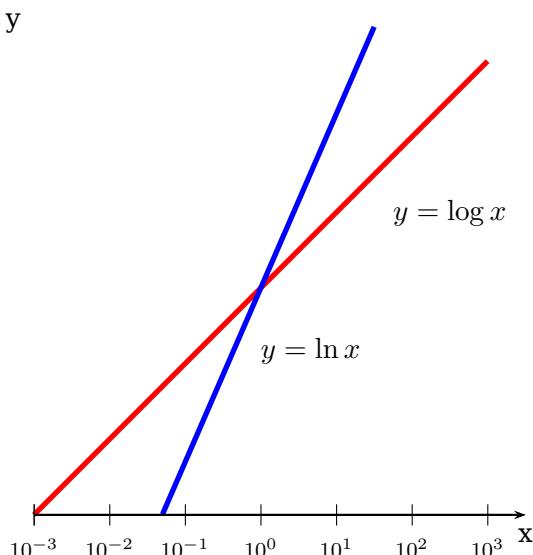

```
\begin{pspicture}(-0.5,-1.25)(6.5,4.5)
\psplot{0}{6}{x x cos add log} % x + cos(x)
\psplot[linecolor=red]{0}{6}{x 3 exp x cos add log}
% x^3 + cos(x)
\psplot[linecolor=cyan]{0}{6}{x 5 exp x cos add log}
% x^5 + cos(x)
\psaxes[ylogBase=10]{->}(0,-1)(0,-1)(6.5,4.5)
\end{pspicture}
```

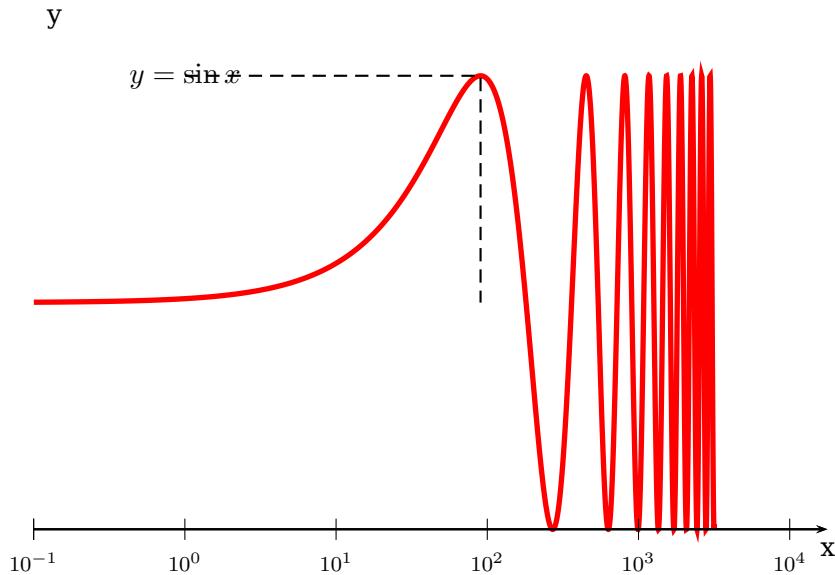

```
\begin{pspicture}(2.5,1.75)(6.5,4.5)
\psplot[linecolor=cyan]{3}{6}{x 5 exp x cos add log} % x^5 + cos(x)
\psaxes[ylogBase=10,0x=3,0y=2]{->}(3,2)(3,2)(6.5,4.5)
\end{pspicture}
```

9.27. xlogBase

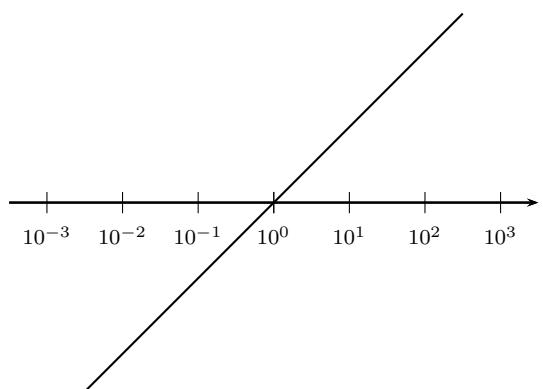

Now we have to use the easy math function $y = x$ because the x axis is still $\log x$.

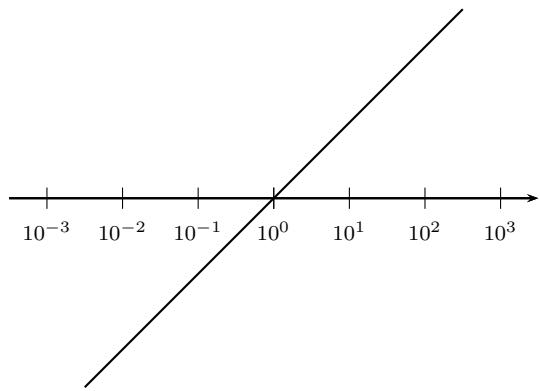

```
\begin{pspicture}(-3.5,-3.5)(3.5,3.5)
\psplot[linewidth=2pt, linecolor=red]{-3}{3}{x} %
\log(x)
\psplot[linewidth=2pt, linecolor=blue]{-1.3}{1.5}{x}
0.4343 div} % \ln(x)
\psaxes[xlogBase=10,0y=-3,0x=-3]{->}(-3,-3)
(3.5,3.5)
\uput[-90](3.5,-3){x}
\uput[180](-3,3.5){y}
\rput(2.5,1){$y=\log x$}
\rput[lb](0,-1){$y=\ln x$}
\end{pspicture}
```

```
\psset{yunit=3cm,xunit=2cm}
\begin{pspicture}(-1.25,-1.25)(4.25,1.5)
\uput[-90](4.25,-1){x}
\uput[0](-1,1.25){y}
\rput(0,1){$y=\sin x$}
\psplot[linewidth=2pt,plotpoints=5000,linecolor=red]{-1}{3.5}{10 x exp sin }
\psaxes[xlogBase=10,0x=-1,0y=-1]{->}(-1,-1)(4.25,1.25)
\psline[linestyle=dashed](-1,0)(4,0)
\psline[linestyle=dashed](!-1 1)(!90 log 1)(!90 log -1)
\psline[linestyle=dashed](!90 log 1)(!180 log 1)(!180 log -1)
\end{pspicture}
```

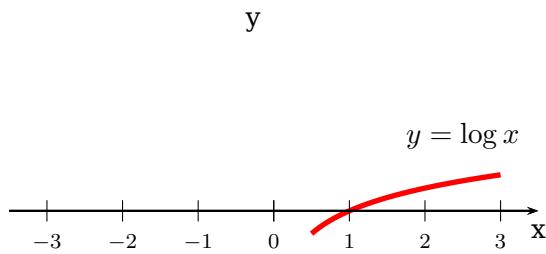

```
\begin{pspicture}(-3.5,-2.5)(3.5,2.5)
\psaxes[xlogBase=10]{->}(0,0)(-3.5,-2.5)(3.5,2.5)
\psplot{-2.5}{2.5}{10 x exp log}
\end{pspicture}
```

```
\begin{pspicture}(-3.5,-2.5)(3.5,2.5)
\psaxes[xlogBase=10,0x={},0y={}]{->}(0,0)
(-3.5,-2.5)(3.5,2.5)
\psplot{-2.5}{2.5}{10 x exp log}
\end{pspicture}
```

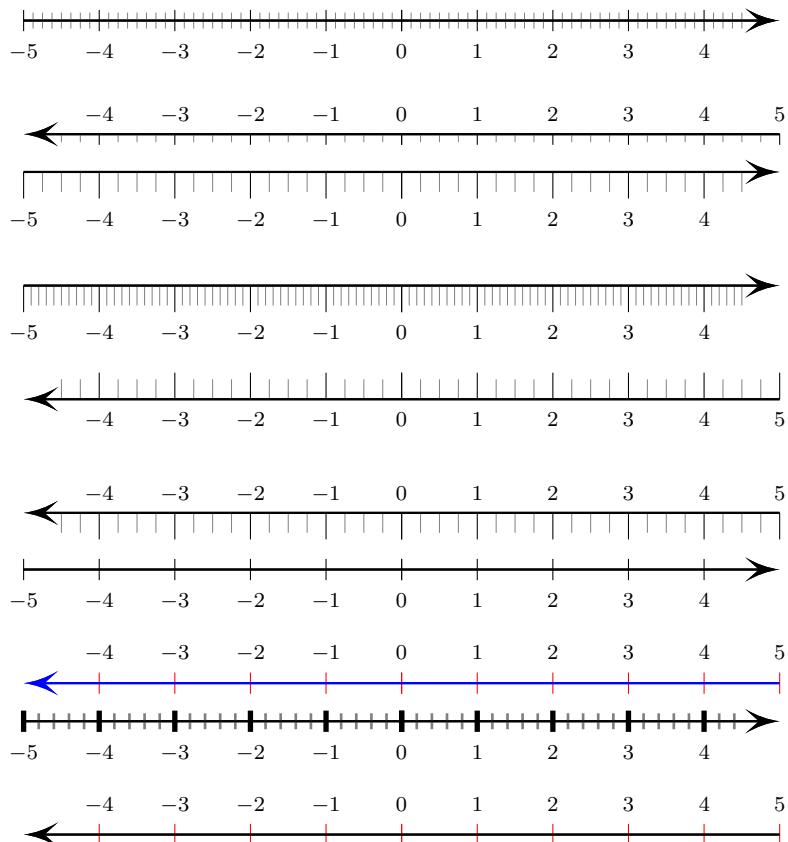

9.28. No logstyle (xylogBase={})

This is only a demonstration that the default option ={} still works ... :-)

```
\begin{pspicture}(-3.5,-0.5)(3.5,2.5)
\psplot[linewidth=2pt, linecolor=red, xylogBase
={}]{0.5}{3}{x log} % log(x)
\psaxes{->}(0,0)(-3.5,0)(3.5,2.5)
\uput[-90](3.5,0){x}
\uput[180](0,2.5){y}
\rput(2.5,1){$y=\log x$}
\end{pspicture}
```

9.29. Option tickwidth and subtickwidth

```
\pset{arrowscale=3,arrows=-D>,yAxis=false}

9.30. Option `psgrid`, `gridcoor`, and `gridpara`

A simple grid can be set with the optional argument `psgrid` which uses the setting of `gridpara` and `gridcoor`. `gridpara` is preset to

```
\gridpara={gridlabels=0pt,gridcolor=red!30,subgridcolor=green!30,
          subgridwidth=0.5\pslinewidth,subgriddiv=5},...
```

```
\usepackage{pst-plot}
\psset{llx=-5mm, lly=-5mm, urx=5mm, ury=5mm, labelFontSize=\scriptstyle,
       algebraic, plotpoints=200, psgrid, gridcoor={(0,0)(9,4)}}
\begin{psgraph}[linecolor=gray]{->}(0,0)(9,4){10cm}{!}
\psplot[linecolor=NavyBlue]{0}{9}{sqrt(x)}% needs dvipsnames
\psdots(*2 {sqrt(2)})(4,2)(4,0)
\uput[90]{*2 {sqrt(2)}}{$(x,y)$}\uput[90](4,2){$(4,2)$}\uput[90](4,0){$(4,0)$}
\rput(7,2.2){\textcolor{NavyBlue}{$y=\sqrt{x}$}}
\end{psgraph}
```

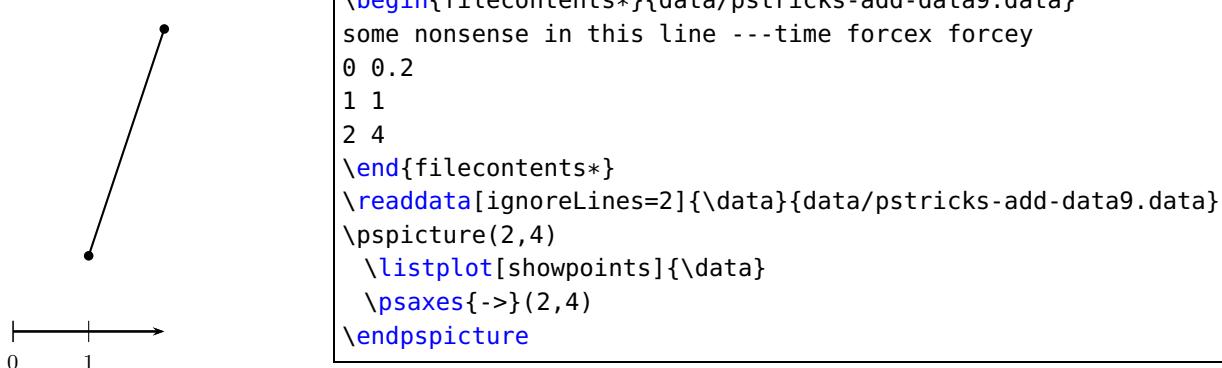

10. New options for \readdata

By default the macro `\readdata` reads every data record, which could be annoying when you have some text lines at top of your data files or when there are more than 10000 records to read.

`pst-plot` defines two additional keys `ignoreLines` and `nStep`, which allows you to ignore preceding lines, e.g. `ignoreLines=2`, or to read only a selected part of the data records, e.g. `nStep=10`, only every 10th record is saved.

```
\readdata[ignoreLines=2]{\dataA}{data/stressrawdata.data}
\readdata[nStep=10]{\dataA}{data/stressrawdata.data}
```

The default value for `ignoreLines` is 0 and for `nStep` is 1. the following data file has two text lines which shall be ignored by the `\readdata` macro:

11. New options for \listplot

By default the plot macros `\dataplot`, `\fileplot` and `\listplot` plot every data record. There are now additional keys `nStep`, `nStart`, `nEnd`, and `xStep`, `xStart`, `xEnd`, which allows to plot only

a selected part of the data records, e.g. `nStep=10`. These "n" options mark the number of the record to be plotted (0, 1, 2,...) and the "x" ones the x-values of the data records.

The new options are only available for the `\listplot` macro, which is not a real limitation, because all data records can be read from a file with the `\readdata` macro (see example files or [**dtk02.2:jackson.voss:plot-funktionen**]):

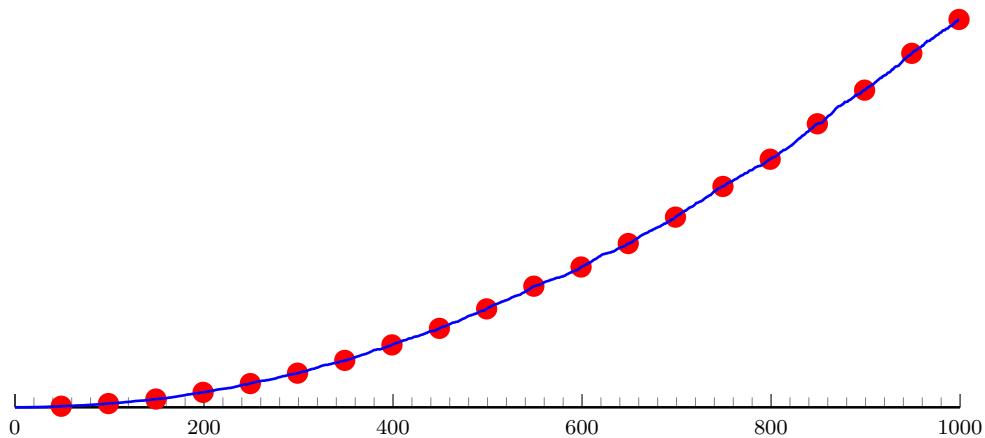

```
\readdata[nStep=10]{\data}{data/data1.data}
```

The use `nStep` and `xStep` options only make real sense when also using the option `plotstyle=dots`. Otherwise the coordinates are connected by a line as usual. Also the `xStep` option needs increasing x values. Note that `nStep` can be used for `\readdata` and for `\listplot`. If used in both macros then the effect is multiplied, e.g. `\readdata` with `nStep=5` and `\listplot` with `nStep=10` means, that only every 50th data record is read and plotted.

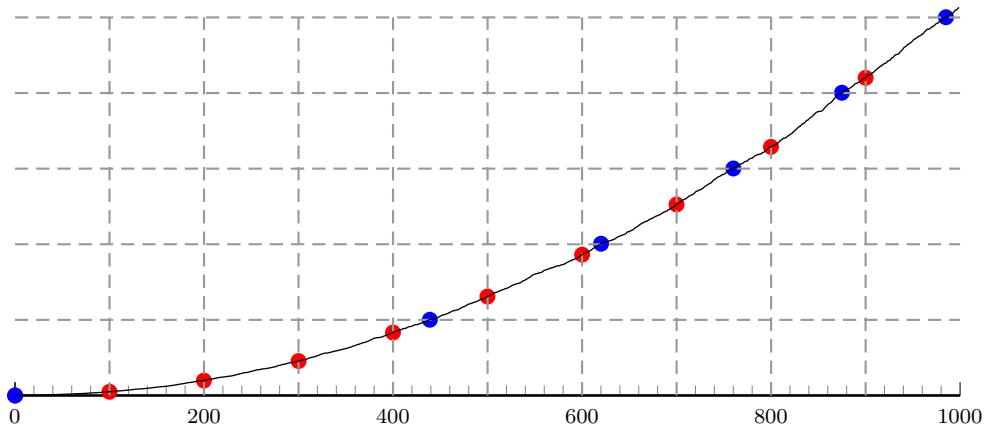

When both, `x/yStart/End` are defined then the values are also compared with both values.

11.1. Options `nStep`, `xStep`, and `yStep`

The datafile `data.data` contains 1000 data records. The thin blue line is the plot of all records with the `plotstyle` option `curve`.

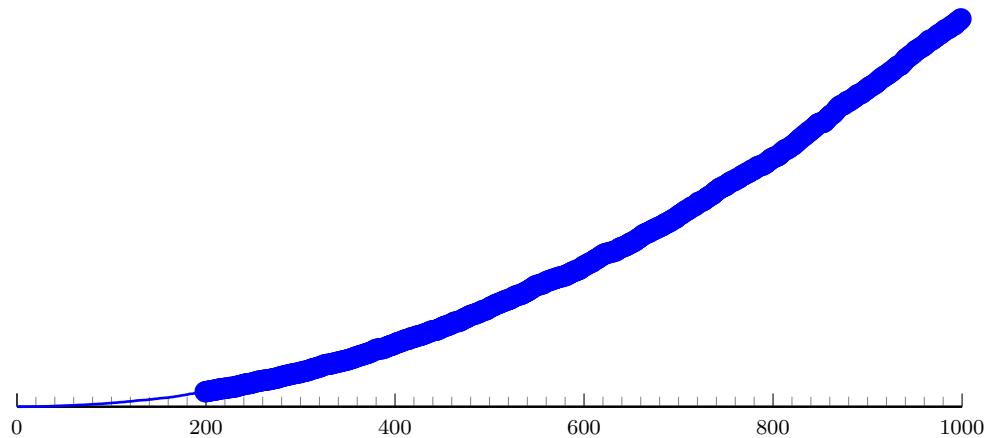

```
\readdata{\data}{data/data.data}
\psset{xunit=12.5cm,yunit=0.2mm}
\begin{pspicture}(-0.080,-30)(1,270)
\pstScalePoints(1,1){1000 div}{1000 div}
\psaxes[Dx=200,dx=2.5cm,Dy=100,ticksize=0 5pt,tickstyle=inner,
    subticks=10, ylabelFactor=\cdot10^3,dy=2cm](0,0)(1,250)
\listplot[nStep=50,linewidth=3pt, linecolor=red, plotstyle=dots]{\data}
\listplot[linewidth=1pt, linecolor=blue]{\data}
\end{pspicture}
```

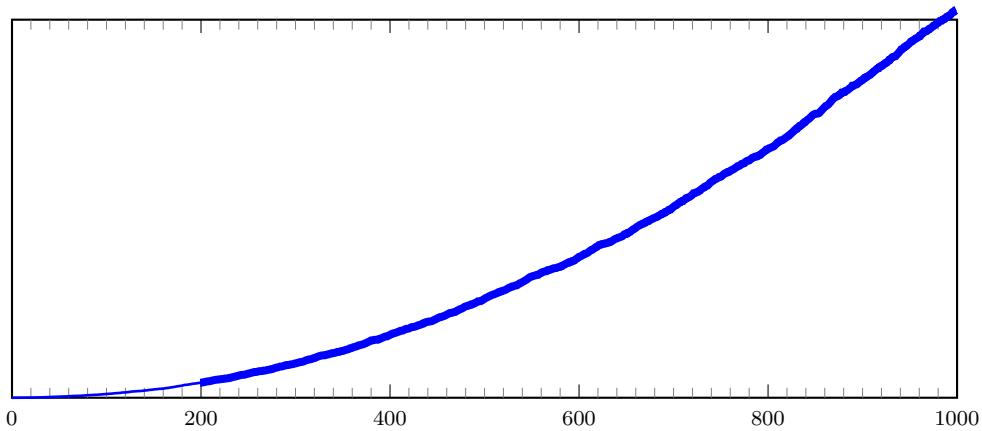

```
\readdata{\data}{data/data.data}
\psset{xunit=12.5cm,yunit=0.2mm}
\begin{pspicture}(-0.080,-30)(1,270)
\pstScalePoints(1,1){1000 div}{1000 div}
\psaxes[Dx=200, dx=2.5cm, Dy=100, ticksize=0 5pt, tickstyle=inner,
    subticks=10, ylabelFactor=\cdot10^3, dy=2cm](0,0)(1,250)
\listplot[xStep=100, linewidth=2pt, linecolor=red, plotstyle=dots]{\data}
\multido{\rA=0.1+0.1}{9}{%
    \psline[linecolor=black!40, linestyle=dashed](\rA,0)(\rA,250)}
\listplot[yStep=50000, linewidth=2pt, linecolor=blue, plotstyle=dots]{\data}
\multido{\nA=50+50}{5}{%
    \psline[linecolor=black!40, linestyle=dashed](0,\nA)(1,\nA)}
\listplot[linewidth=0.5pt]{\data}
\end{pspicture}
```

11.2. Options `nStart` and `xStart`

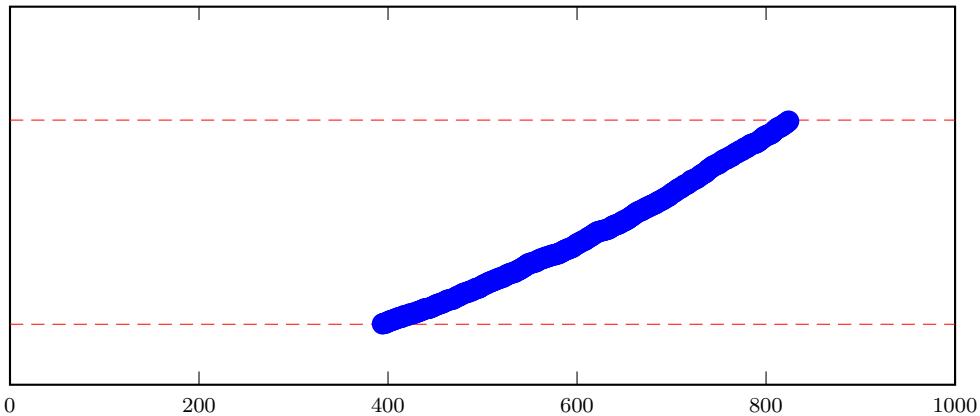

```
\readdata{\data}{data/data.data}
\psset{xunit=12.5cm,yunit=0.2mm}
\begin{pspicture}(-0.080,-30)(1,270)
\pstScalePoints(1,1){1000 div}{1000 div}
\psaxes[Dx=200,dx=2.5cm,Dy=100,ticksize=0 5pt,tickstyle=inner,
    subticks=10, ylabelFactor=\cdot10^3,dy=2cm](0,0)(1,250)
\listplot[nStart=200,linewidth=3pt,
    linecolor=blue,plotstyle=dots]{\data}
\listplot[linewidth=1pt,linecolor=blue]{\data}
\end{pspicture}
```

11.3. Options `nEnd` and `xEnd`

```
\readdata{\data}{data/data.data}
\psset{xunit=12.5cm,yunit=0.2mm}
\begin{pspicture}(-0.080,-30)(1,270)
\pstScalePoints(1,1){1000 div}{1000 div}
\psaxes[axesstyle=frame,Dx=200,dx=2.5cm,Dy=100,ticksize=0 5pt,tickstyle=inner,
subticks=10,labelFactor=\cdot10^3,dy=2cm](0,0)(1,250)
\listplot[nStart=200,linewidth=3pt,
linecolor=blue]{\data}
\listplot[linewidth=1pt,linecolor=blue]{\data}
\end{pspicture}
```

11.4. Options `yStart` and `yEnd`

```
\readdata{\data}{data/data.data}
\psset{xunit=12.5cm,yunit=0.2mm}
\begin{pspicture}(-0.080,-30)(1,270)
\pstScalePoints(1,1){1000 div}{1000 div}
\psaxes[axesstyle=frame,Dx=200,dx=2.5cm,Dy=100,ticksize=0 5pt,tickstyle=inner,
    ylabelFactor=\cdot10^3,dy=2cm](0,0)(1,250)
\psset{linewidth=0.1pt, linestyle=dashed, linecolor=red}
\psline(0,40)(1,40)
\psline(0,175)(1,175)
\listplot[yStart=40000, yEnd=175000, linewidth=3pt, linecolor=blue, plotstyle=dots]{\data}
\end{pspicture}
```

11.5. Options `plotNo`, `plotNoX`, and `plotNoMax`

By default the plot macros expect $x|y$ data records, but when having data files with multiple values for y , like:

```
x y1 y2 y3 y4 ... yMax
x y1 y2 y3 y4 ... yMax
...
...
```

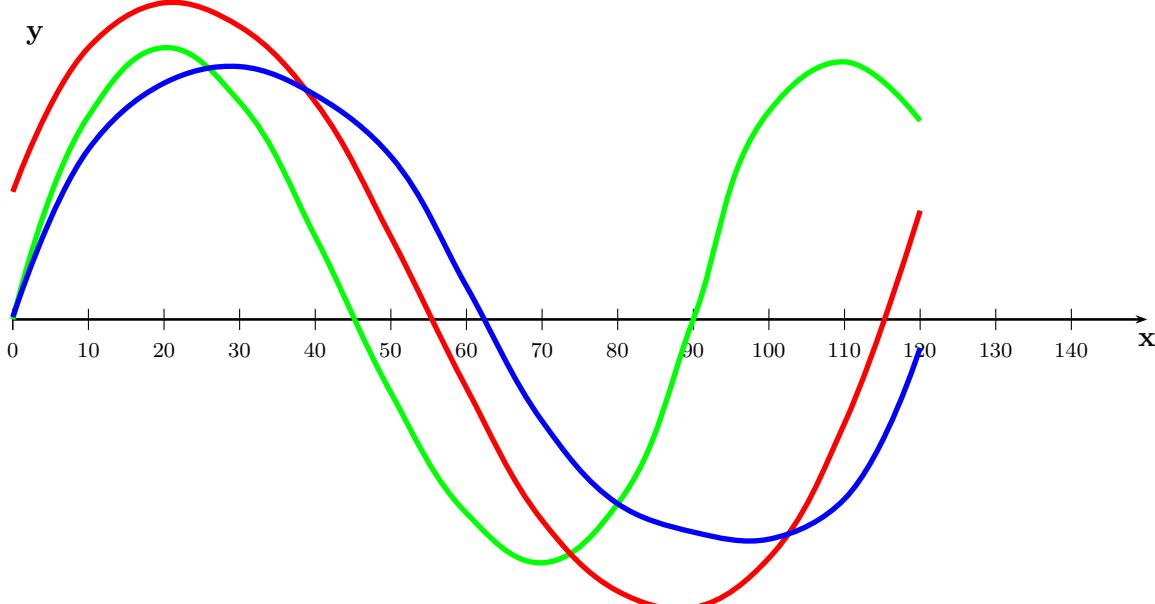

you can select the y value which should be plotted. The option `plotNo` marks the plotted value (default 1) and the option `plotNoMax` tells `pst-plot` how many y values are present. There are no real restrictions in the maximum number for `plotNoMax`.

We have the following data file:

```
[% file data.data
0  0   3.375  0.0625
10 5.375  7.1875  4.5
20 7.1875  8.375  6.25
30 5.75   7.75   6.6875
40 2.1875  5.75   5.9375
50 -1.9375  2.1875  4.3125
60 -5.125   -1.8125  0.875
70 -6.4375  -5.3125 -2.6875
80 -4.875   -7.1875 -4.875
90 0       -7.625   -5.625
100 5.5    -6.3125 -5.8125
```

```
110  6.8125 -2.75 -4.75
120  5.25  2.875 -0.75
]%
```

which holds data records for multiple plots (x y_1 y_2 y_3). This can be plotted without any modification to the data file:

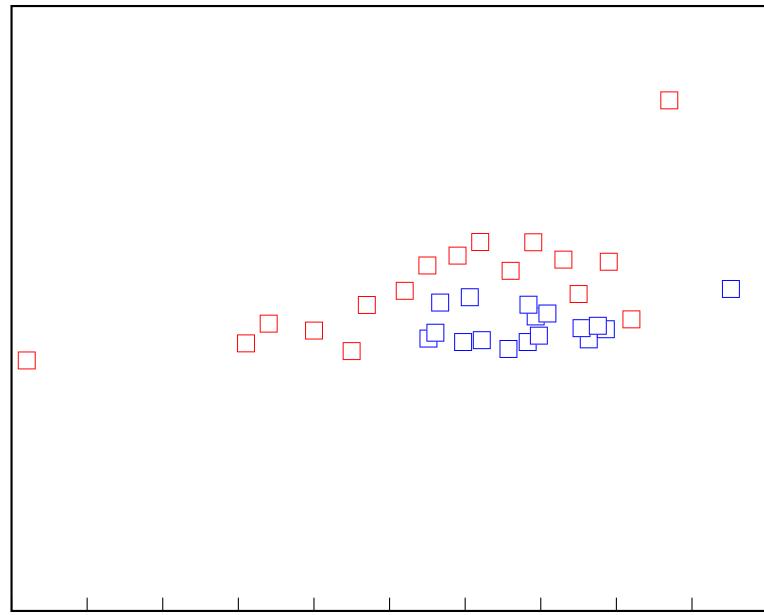

```
\readdata{Data}{data/dataMul.data}
\psset{xunit=0.1cm, yunit=0.5cm,lly=-0.5cm}
\begin{pspicture}(0,-7.5)(150,10)
\psaxes[Dx=10,Dy=2.5]{->}(0,0)(0,-7.5)(150,7.5)[\mathbf{x},-90][\mathbf{y},0]
\psset{linewidth=2pt,plotstyle=curve}
\listplot[linecolor=green,plotNo=1,plotNoMax=3]{Data}
\listplot[linecolor=red,plotNo=2,plotNoMax=3]{Data}
\listplot[linecolor=blue,plotNo=3,plotNoMax=3]{Data}
\end{pspicture}
```

It is also possible to select another column for the x -value. Suppose we have a data base with records like x y y x y , then it is by default a record with one x value and four possible y values. We still have to define `plotNoMax=4`. However, it is possible to select the forth value as new x value by setting `plotNoX=4` (it is preset to 1). Then the forth value is taken as x . The example uses the the following data set.

	X1	X2	Y1	Y2
2	55.1500	10.35	11.26	
31	59.7167	11.06	11.11	
34	65.7167	11.87	10.83	
40	62.1833	11.59	11.19	
45	56.0500	10.74	11.50	
47	68.2667	12.65	11.11	
52	69.7500	13.23	11.38	
55	76.3333	14.28	11.22	
59	75.4000	14.69	11.69	
62	78.6000	15.25	11.64	

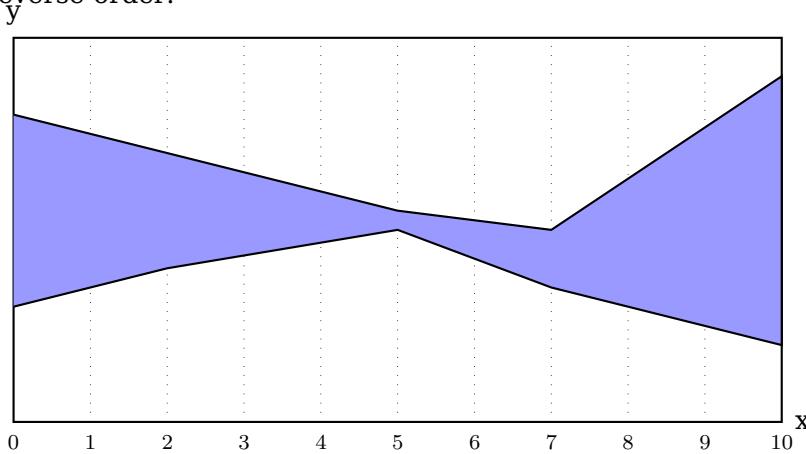

```
66 69.3167 14.06 12.17
69 77.5500 15.24 11.79
73 70.8833 14.52 12.29
75 60.6167 13.10 12.97
79 68.3833 14.43 12.66
82 56.6833 12.05 12.75
87 95.1333 21.10 13.31
```

```
\readdata{\data}{data/demo.txt}
\psset{xAxisLabel={},yAxisLabel={},llx=-5mm}
\begin{psgraph}[axesstyle=frame,Dy=5,Dx=10,ticksize=5pt 0](0,0)(100,25){10cm}{8cm}
\psset{dotstyle=square,dotscale=1.5,linewidth=1.5pt}
\listplot[plotNoMax=3,plotNo=2,linecolor=red,plotstyle=dots]{\data}
\listplot[plotNoMax=3,plotNoX=2,plotNo=3,linecolor=blue,plotstyle=dots]{\data}
\end{psgraph}
```

11.6. Option `changeOrder`

It is only possible to fill the region between two listplots with `\pscustom` if one of them has the values in reverse order. Otherwise we do not get a closed path. With the option `ChangeOrder` the values are used in reverse order:

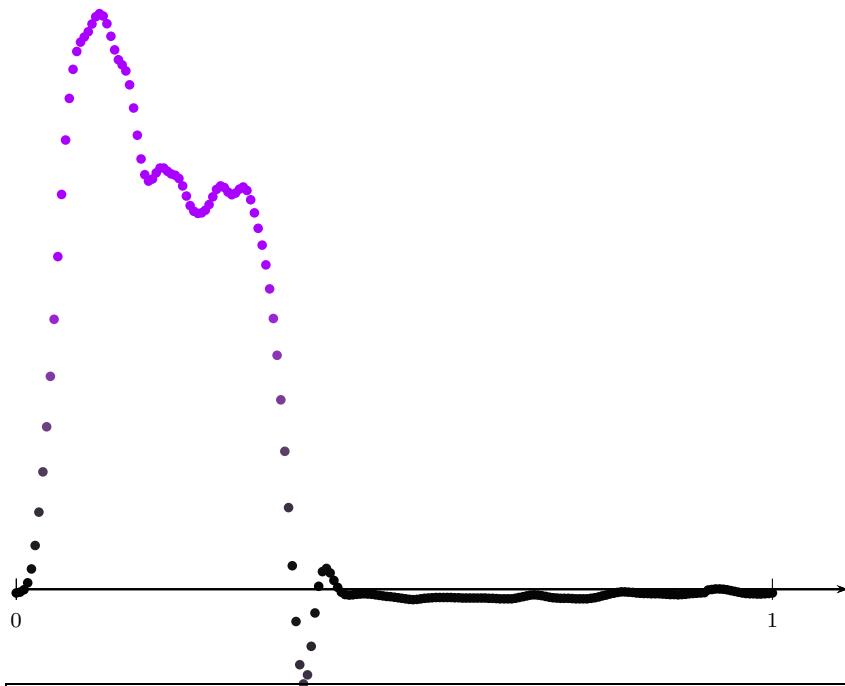

```
\begin{filecontents*}{data/test.data}
0 3 8
2 4 7
5 5 5.5
7 3.5 5
10 2 9
\end{filecontents*}
\psset{lly=-.5cm}
\begin{psgraph}[axesstyle=frame,ticklinestyle=dotted,ticksize=0 10](0,0)(10,10){4in}{2in}%
\readdata{\data}{data/test.data}%
\pscustom[fillstyle=solid,fillcolor=blue!40]{%
\listplot[plotNo=2,plotNoMax=2]{\data}%
\listplot[plotNo=1,plotNoMax=2,ChangeOrder]{\data}}
\end{psgraph}
```

12. New plot styles

12.1. Plot style colordot and option Hue

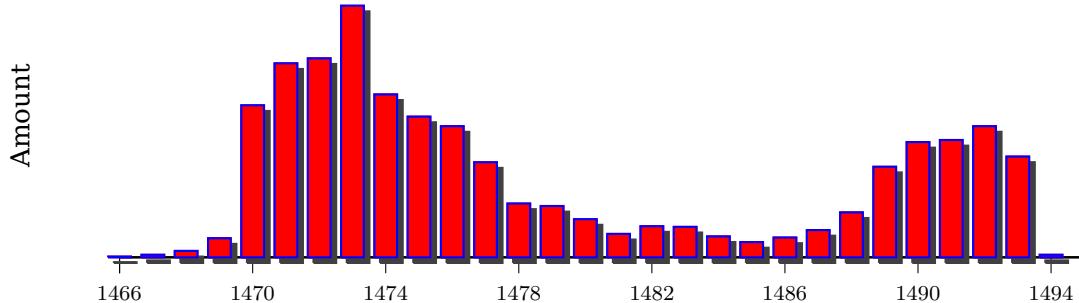

The plotted dots can be colored with the HSB color model, where Hue is set by an angle (0...360) and the values of Saturation and Brightnes are set by the relative y value of the data records. The default value for Hue is 180.

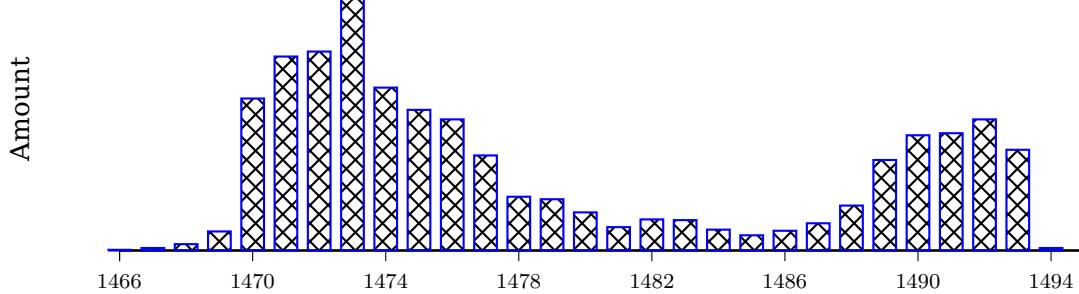

```
\readdata{\data}{data/data3.data}
\psset{xunit=10,yunit=0.02}
\begin{pspicture}(0,-50)(1.1,400)
 \psaxes[dy=1cm,Dy=50]{->}(0,0)(0,-50)(1.1,400)
 \listplot[Hue=280,plotstyle=colordots]{\data}
\end{pspicture}
```

12.2. Plot style bar and option barwidth

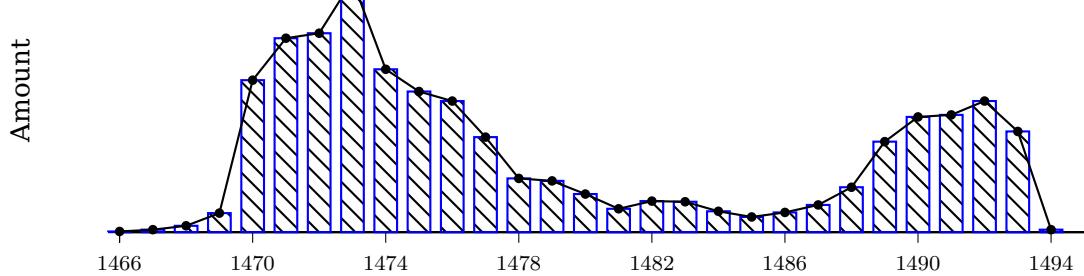

This option allows you to draw bars for the data records. The width of the bars is controlled by the option `barwidth`, which is set by default to value of `0.25cm`, which is the total width.

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)
\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,xticksize=-6pt 0,
ylabelFactor={\,\%,}{-})(29,12)
\listplot[shadow=true,linecolor=blue,plotstyle=bar,barwidth=0.3cm,
fillcolor=red,fillstyle=solid]{\barData}
\rput{90}{(-3,6.25){Amount}}
\end{pspicture}
```

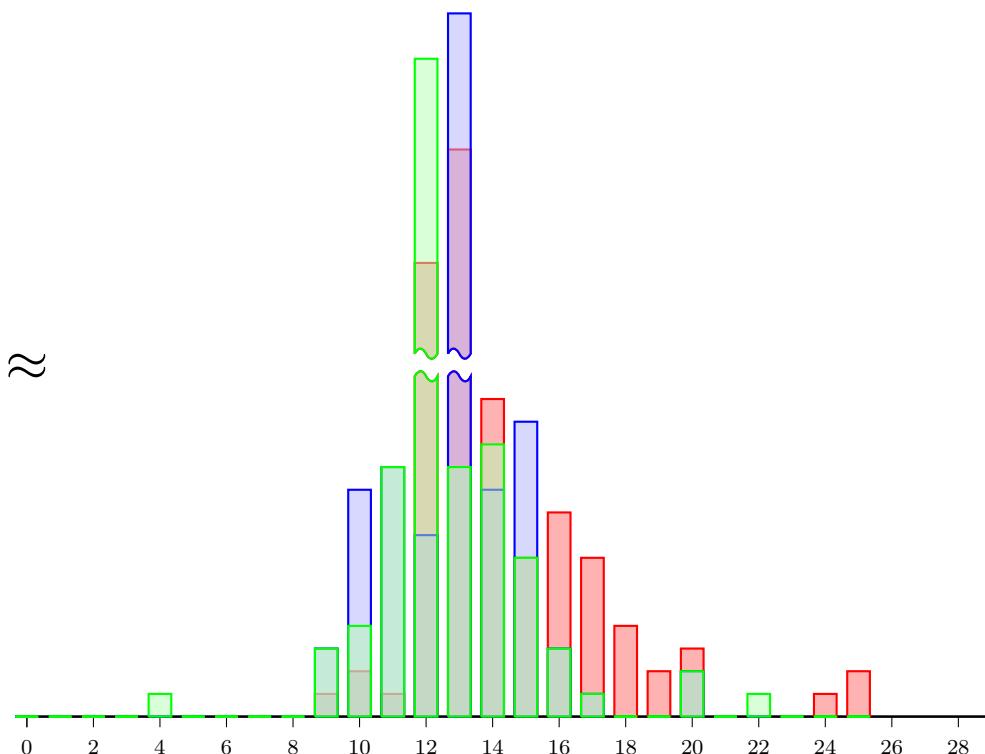

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)
\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,ticksize=-4pt 0,
ylabelFactor={\,\%,}{-})(29,12)
\listplot[linecolor=blue,plotstyle=bar,barwidth=0.3cm,
fillcolor=red,fillstyle=crosshatch]{\barData}
\rput{90}{(-3,6.25){Amount}}
\end{pspicture}
```

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,13)
\psaxes[axesstyle=axes,0x=1466,0y=0,Dx=4,Dy=2,ticksize=-4pt 0,
ylabelFactor={\,,\%}{-}]{29,12}
\listplot[linecolor=blue,plotstyle=bar,barwidth=0.3cm,
fillcolor=red,fillstyle=vlines]{\barData}
\listplot[showpoints=true]{\barData}
\rput{90}{(-3,6.25)}{Amount}
\end{pspicture}
```

Interrupted bar plot

The new keyword `interrupt` takes three comma separated values: the value, when the interrupted y axis is interrupted, the separation for the drawn tilde and the value for the interrupted section, e.g. `interrupt={15,1,30}`.

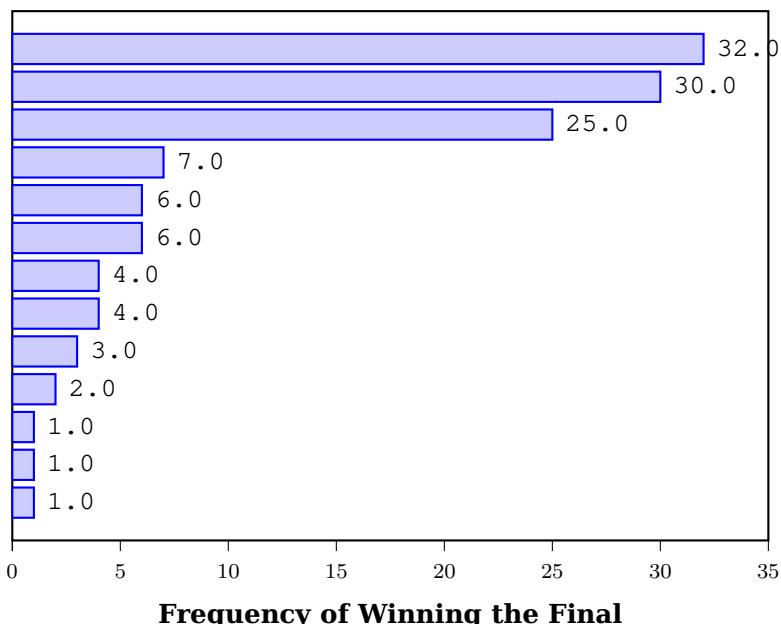

```
\psset{xunit=.44cm,yunit=.3cm}
\begin{pspicture}(-2,-3)(29,32)
\psaxes[axesstyle=axes,ticksize=-4pt 0,Dy=2,Dx=2]{29,15}
```

```
\rput(0,15.4){\textbf{\huge$\approx$}}
\rput(0,16){\psaxes[xAxis=false,ticksize=-4pt 0,
Dy=2,0y=46,Dx=2](29,15)}
\psset{interrupt={15,1,30}}
\listplot[linecolor=red,plotstyle=bar,barwidth=0.3cm,
fillcolor=red!30,fillstyle=solid]{
0 0 1 0 2 0 3 0 4 0 5 0 6 0 7 0 8 0 9 1 10 2
11 1 12 50 13 55 14 14 15 7 16 9 17 7 18 4
19 2 20 3 21 0 22 0 23 0 24 1 25 2 % 1st example
}
\listplot[linecolor=blue,plotstyle=bar,barwidth=0.3cm,
fillcolor=blue!30,fillstyle=solid,opacity=0.5]{
0 0 1 0 2 0 3 0 4 0 5 0 6 0 7 0 8 0 9 3 10 10
11 11 12 8 13 61 14 10 15 13 16 3 17 1 18 0
19 0 20 2 21 0 22 0 23 0 24 0 25 0 % 2nd exa
}
\listplot[linecolor=green,plotstyle=bar,barwidth=0.3cm,
fillcolor=green!30,fillstyle=solid,opacity=0.5]{
0 0 1 0 2 0 3 0 4 1 5 0 6 0 7 0 8 0 9 3 10 4
11 11 12 59 13 11 14 12 15 7 16 3 17 1 18 0
19 0 20 2 21 0 22 1 23 0 24 0 25 0 % 3rd exa
}
\end{pspicture}
```

12.3. Plot style ybar

With the setting `plotstyle=ybar` the graph is set with horizontal bars instead of vertical. For `yLabels` see section ??.

```
\savedata{\data}[1 1 1 2 1 3 2 4 3 5 4 6 4 7 6 8 6 9 7 10 25 11 30 12 32 13]

\psset{llx=-1.5cm,lly=-1.5cm,xAxisLabel=\textbf{Frequency of Winning the Final},
xAxisLabelPos={c,-1cm},yAxisLabel=,yLabels={Kerry,Laois,London,Waterford,Clare,Offaly,
```

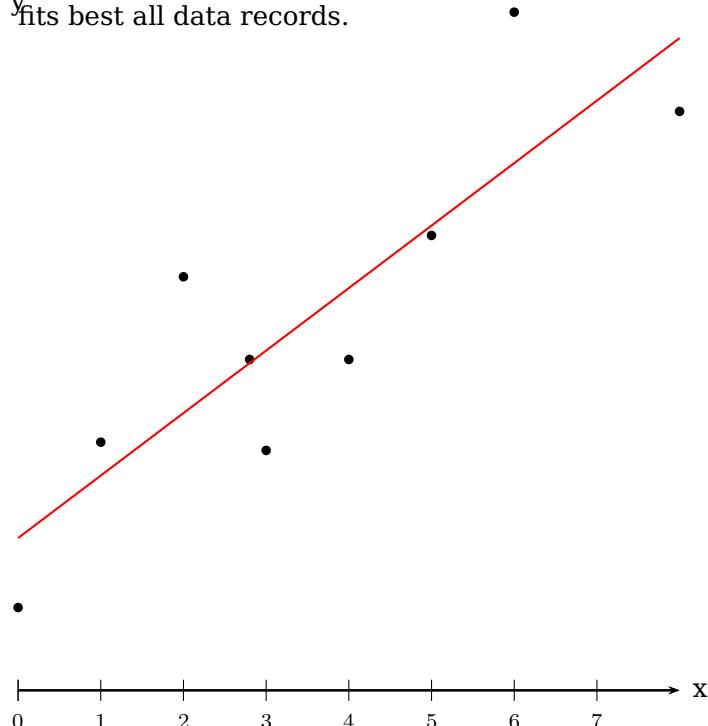

```

Galway,Wexford,Dublin,Limerick,Tipperary,Cork,Kilkenny}}
\begin{psgraph}[axesstyle=frame,labels=x,ticksize=-4pt 0,Dx=5](0,0)(35,14){10cm}{7cm}
\listplot[plotstyle=ybar,fillcolor=blue!20,linecolor=blue,barwidth=4mm,fillstyle=solid
]{\data}
\listplot[plotstyle=xvalues,labelsep=5pt]{\data}
\end{psgraph}

```

12.4. Plotstyle LSM

With the setting `plotstyle=LSM` (**Least Square Method**) the data records are not printed in the usual way as dots or a line, the `\listplot` macro calculates the values for a line $y = v \cdot x + u$ which fits best all data records.

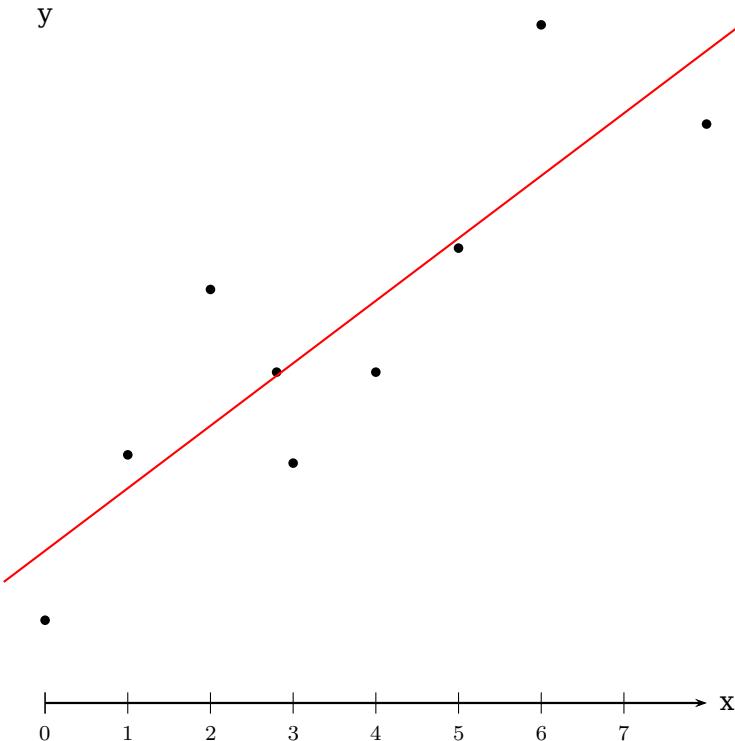

```

\begin{filecontents*}{data/LSM.data}
0 1 1 3 2.8 4 3 2.9 2 5 4 4 5 5.5 6 8.2 8 7
\end{filecontents*}
\psset{lly=-.5cm}
\readdata{\data}{data/LSM.data}
\begin{psgraph}[arrows=->](0,0)(0,0)(8,8){.5\textwidth}{!}
\listplot[plotstyle=dots]{\data}
\listplot[plotstyle=LSM, linecolor=red]{\data}
\end{psgraph}

```

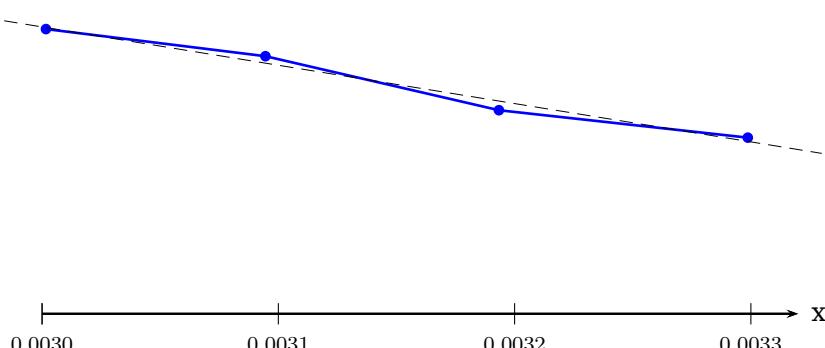

The macro looks for the lowest and biggest x-value and draws the line for this interval. It is possible to pass other values to the macro by setting the `xStart` and/or `xEnd` options. They are preset with an empty value {}.

$$y=0.755679 \cdot x + 1.84104$$

```
\readdata{\data}{data/LSM.data}
\psset{lly=-1.75cm}
\begin{psgraph}[arrows=>](0,0)(0,0)(8,8){.5\textrightarrowwidth}{!}
    \listplot[plotstyle=dots]{\data}
    \listplot[PstDebug,plotstyle=LSM,xStart=-0.5,xEnd=8.5,linecolor=red]{\data}
\end{psgraph}
```

With `PstDebug` one gets the equation $y = v \cdot x + u$ printed, beginning at the position (0|50pt). This cannot be changed, because it is only for some kind of debugging. Pay attention for the correct `xStart` and `xEnd` values, when you use the `\pstScalePoints` Macro. In the following example we use an x-interval from 0 to 3 to plot the values; first we subtract 0.003 from all x-values and then `yscale` them with 10000. This is not taken into account for the `xStart` and `xEnd` values.

$$y=-0.304095 \cdot x + 2.27634$$

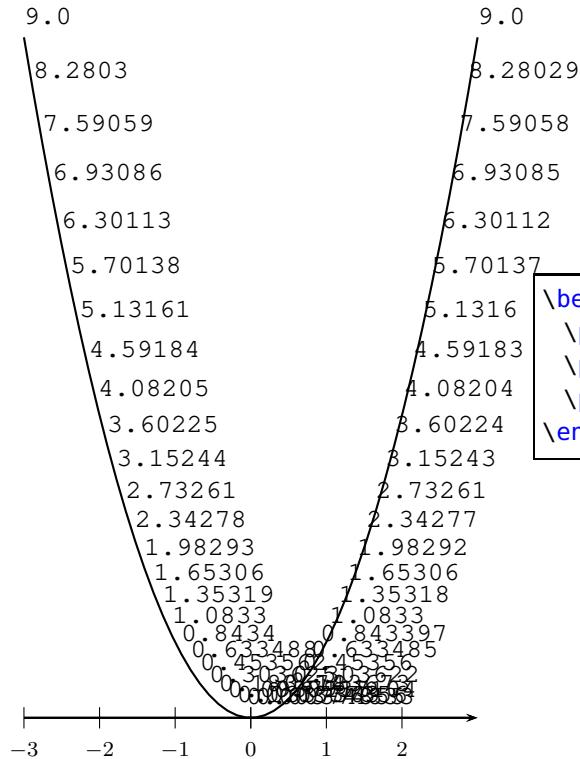

```
\begin{filecontents*}{data/LSM2.data}
0.003298697 1.397785583

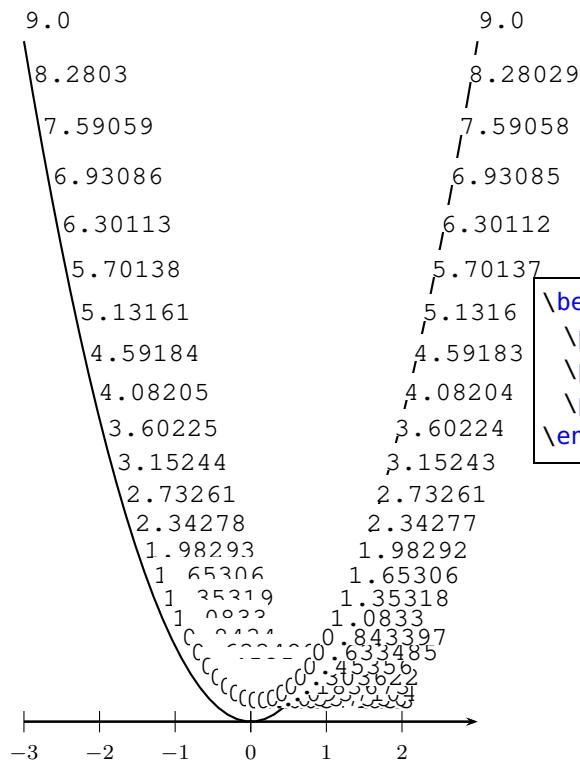

```

```
0.003193358 1.615489564
0.003094538 2.044019006
0.003001651 2.259240127
\end{filecontents*}
\readdata{\data}{data/LSM2.data}
\pstScalePoints(10000,1){ 0.003 sub }{}
\psset{lly=-1.75cm}
\psgraph[arrows=->,0x=0.0030,Dx=0.0001,dx=\psxunit](0,0)(3.2,3){10cm}{5cm}
\listplot[showpoints=true,linewidth=1pt,linecolor=blue]{\data}
\listplot[PstDebug=1,plotstyle=LSM,linewidth=0.1pt,linestyle=dashed,%  
xStart=-0.25,xEnd=3.3]{\data}
\endpsgraph
```

12.5. Plotstyles values and values*

Instead of plotting the curve with the setting `plotstyle=values` the y -values are printed at the current point.

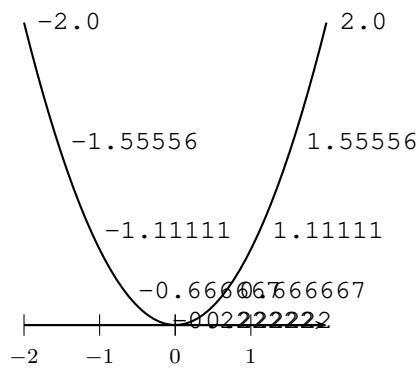

```
\begin{pspicture}(-3.5,-.5)(3.5,9.5)
\psaxes{->}(0,0)(-3,0)(3,9)
\psplot[-3]{3}{x dup mul}
\psplot[plotstyle=values*]{-3}{3}{x dup mul}
\end{pspicture}
```

12.6. Plotstyles xvalues and xvalues*

This is similar to the options `values`, except that it plots the x -values instead of the y -values. This maybe useful when also using the plotstyle `ybar` (see Section 12.3 on page 76).

```
\begin{pspicture}(-2.5,-.5)(2.5,5.5)
\psaxes{->}(0,0)(-2,0)(2,5.5)
\psplot[-2]{2}{x dup mul}
\psplot[plotstyle=xvalues,
plotpoints=10]{-2}{2}{x dup mul}
\end{pspicture}
```

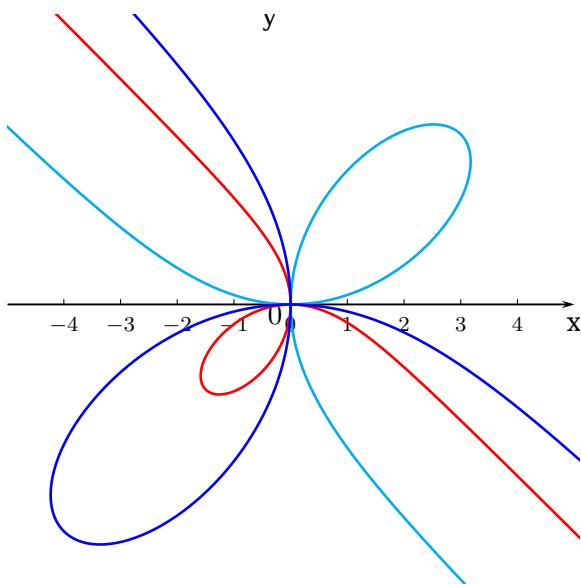

13. Polar plots

With the option `polarplot=false|true` it is possible to use any plot command in polar mode:

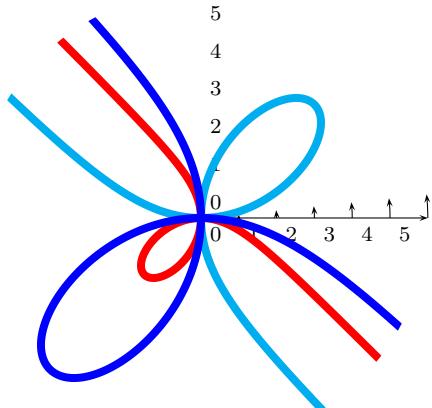

```
\ps????plot [polarplot,...] {<start angle>} {<end angle>}%
[PS command] {<r(alpha)>}
```

The equation in PostScript code is interpreted as a function $r = f(\alpha)$, e.g. for the circle with radius 1 as $r = \sqrt{\sin^2 x + \cos^2 x}$, or $r = a * \frac{\sin(x) * \cos(x)}{(\sin(x)^3 + \cos(x)^3)}$ for the following examples:

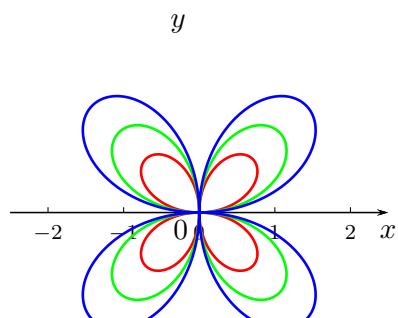

```
x sin dup mul x cos dup mul add sqrt
```

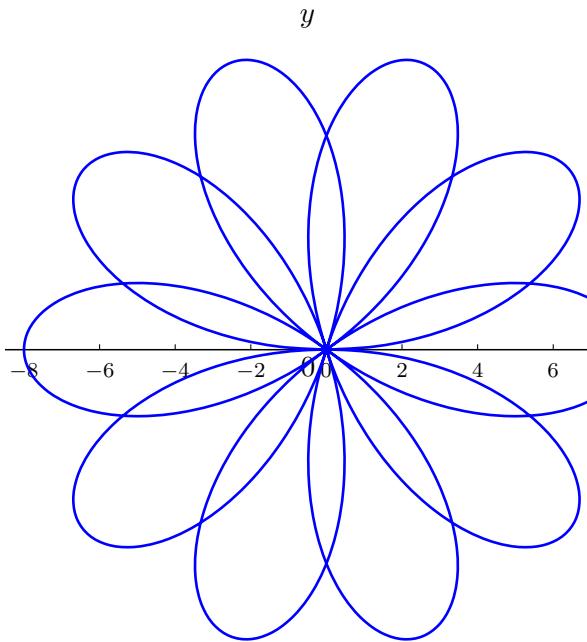

```
\psset{plotpoints=200,unit=0.75}
\begin{pspicture}*(-5,-5)(5.1,5.1)
\psaxes[arrowlength=1.75,ticksize=2pt,labelFontSize=\scriptstyle,
 linewidth=0.2mm]{->}(0,0)(-4.99,-4.99)(5,5)[x,-90][y,180]
\rput[Br]{-.15,-.35}{$\theta$} \psset{linewidth=.35mm,polarplot}
\psplot[linecolor=red]{140}{310}{3 neg x sin mul x cos mul x sin 3 exp x cos 3 exp add div
}
\psplot[linecolor=cyan]{140}{310}{6 x sin mul x cos mul x sin 3 exp x cos 3 exp add div}
\psplot[linecolor=blue,algebraic]{2.44}{5.41}{-8*sin(x)*cos(x)/(sin(x)^3+cos(x)^3)}
\end{pspicture}
```

```
\psset{unit=0.5cm}
\begin{pspicture}(-6,-6)(6,6)

\psset{linewidth=.35mm,plotstyle=curve,polarplot
    }
\psplot[linecolor=blue]{0}{720}{8 2.5 x mul sin
mul}
\end{pspicture}
```

14. New macros

14.1. \psCoordinates

```
\psCoordinates [Options] (x,y)
```

A special optional argument is `markPoint` which is preset to `true`. With `showpoints` one can set all three points with the same symbol: start point, curve point, and end point.

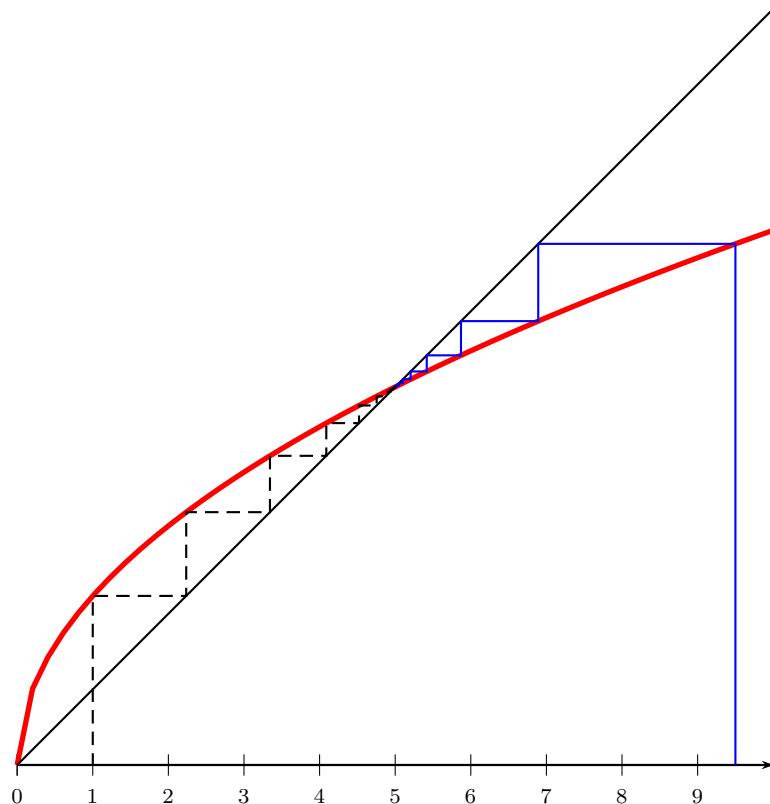

```
\begin{pspicture}(-5mm,-1cm)(10,10)
\psaxes{->}(10,10)
\psplot[algebraic,linecolor=red,linewidth=2pt]{0}{10}{x^2/10}
\psCoordinates(*1.5 {x^2/10})
\psCoordinates[showpoints](*2.2 {x^2/10})
\psCoordinates[linecolor=blue,linestyle=dashed,
dotstyle=square,dotscale=2](*4 {x^2/10})
\psCoordinates[arrowscale=1.5,arrows=->,markPoint=false](*6 {x^2/10})
\psCoordinates[linecolor=blue,linewidth=0.3pt,
dotstyle=x,dotscale=2,showpoints](*7 {x^2/10})
\psCoordinates[arrows=->,linecolor=blue,linestyle=dotted,
dotstyle=triangle,dotscale=2,showpoints](*8 {x^2/10})
\psCoordinates[dotscale=2](*9 {x^2/10})
\end{pspicture}
```

14.2. \psFixpoint

```
\psFixpoint [Options] {x0}{f(x)}{n}
```

x_0 is the start value of the iteration, $f(x)$ the function, which can either be in postfix or algebraic notation, for the latter it needs the optional argument `algebraic`. The number of the iteration is given by n .

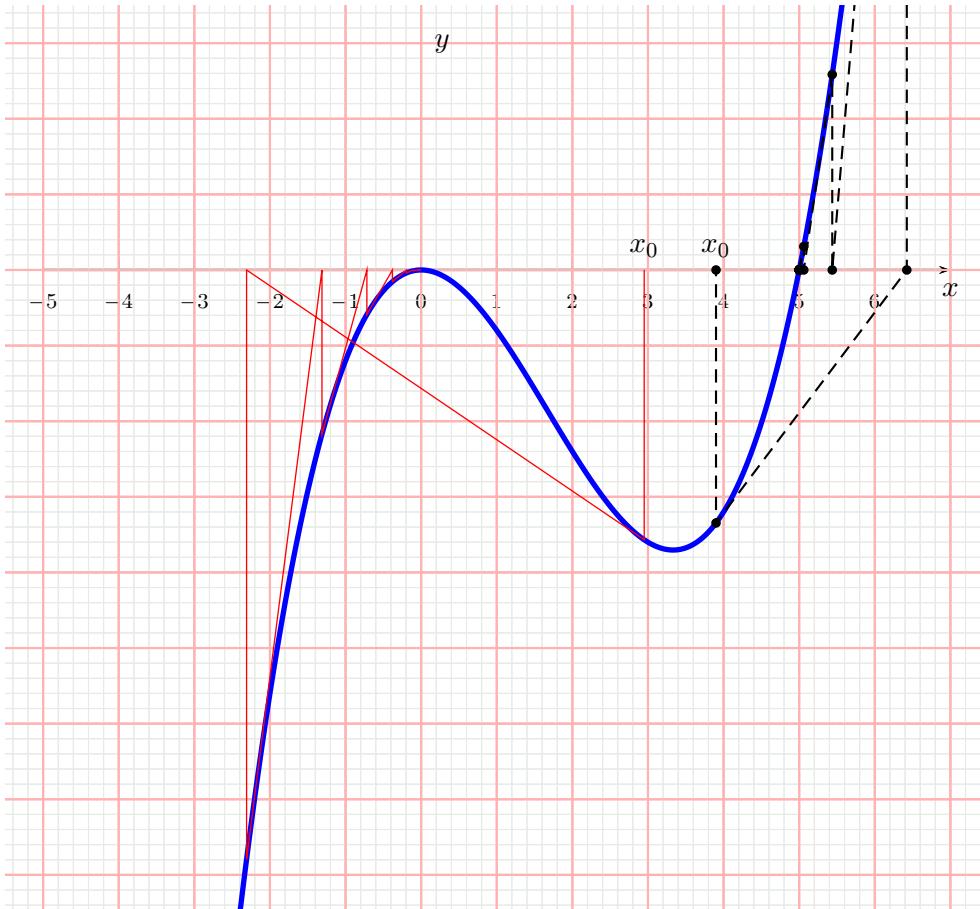

```
\begin{pspicture}[algebraic](-5mm,-1cm)(10,10)
\psaxes{->}(10,10)
\psplot[linecolor=red,linewidth=2pt]{0}{10}{sqrt(5*x)}
\psline(10,10)
\psFixpoint[linecolor=blue]{9.5}{sqrt(5*x)}{20}
\psFixpoint[linestyle=dashed]{1}{sqrt(5*x)}{20}
\end{pspicture}
```

14.3. \psNewton

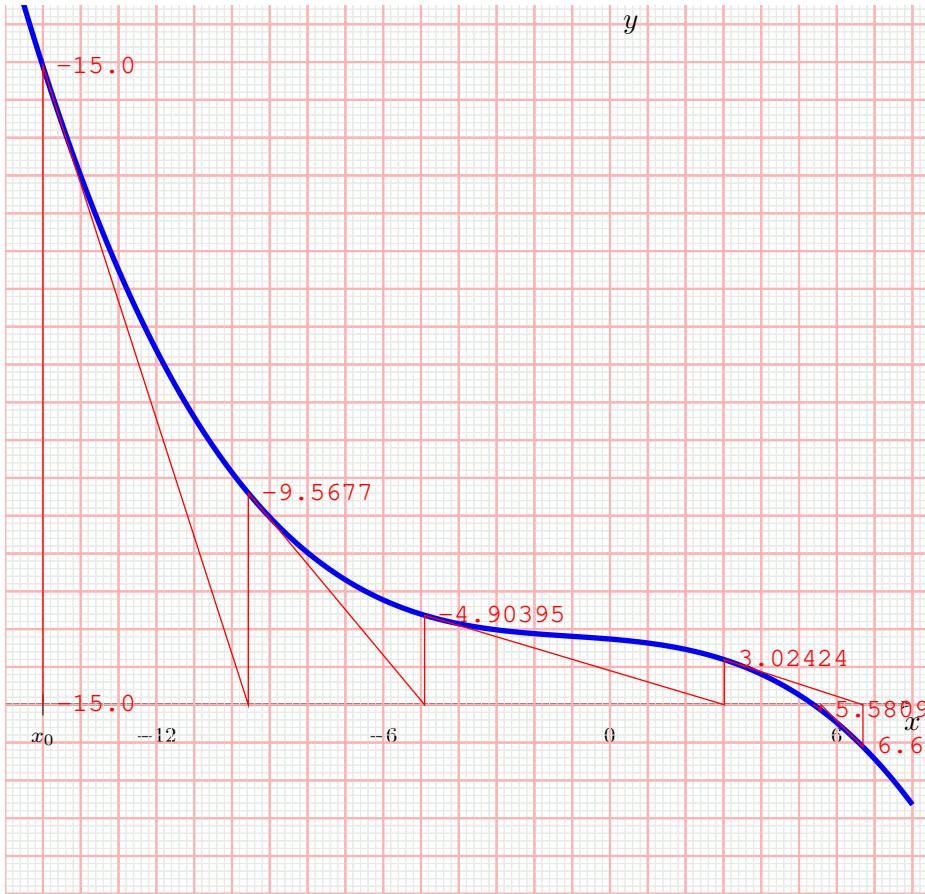

```
\psNewton [Options] {x0}{f(x)} [f'(x)] {n}
```

If the optional derivation of the function $f(x)$ is missing, then the macro itself calculates the derivation with an interval of ± 0.01 . It can be changed by setting the optional argument `VarStepEpsilon` to another value. If the derivation is also given as a function, it is used without any check for the values.

```
\def\f{1/5*x^3-x^2}
\psset{plotpoints=2000,algebraic}
%
\begin{pspicture*}[-5,-8)(7,3.5)
\psaxes{>}(0,0)(-5,-8)(7,3)[x$,270][y$,0]
\psplot[linewidth=2pt, linecolor=blue]{-5}{8}{\f}
\uput[90](2.95,0){$x_0$}\uput[90](3.9,0){$x_1$}
\psNewton[linecolor=red, linewidth=0.5pt]{2.95}{\f}{10}
\psNewton[showpoints, linestyle=dashed]{3.9}{\f}{8}
\end{pspicture*}
```

x_0 is the start value of the iteration, $f(x)$ the function, which can either be in postfix or algebraic notation, for the latter it needs the optional argument `algebraic`. The number of the iteration is given by n . All defined plotstyles can be used, but there maybe PostScript errors for `plotstyle=values` if the number of steps is too big. In such a case decrease the number of steps.

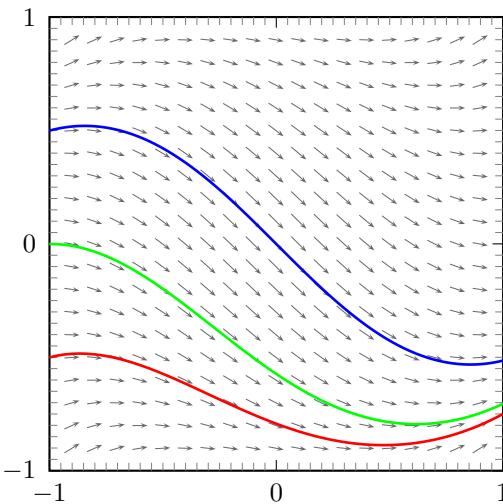

```
\def\f{-(1/192)*x^3-(1/12)*x-(1/192)*Pi*x^2-(1/12)*Pi*x}
\def\fDerive{-(3/192)*x^2-(1/12)-(2/192)*Pi*x}
\psset{plotpoints=2000,unit=0.5,algebraic}
%
\begin{pspicture*}[-16,-5](8.5,18.5)
\psaxes[Dx=6,Dy=4]{->}(0,0)(-16,-5)(8,18)[x$,270][y$,0]
\psplot[algebraic,linewidth=2pt,linecolor=blue]{-20}{8}{\f}
\psxTick{-15}{x_0}
\psNewton[linecolor=red,linewidth=0.5pt]{-15}{\f}{12}
\psNewton[linecolor=red,linewidth=0.5pt,plotstyle=xvalues,showDerivation=false]{-15}{\f}{6}
%
%-15, -9.567466932, -4.903526029, 3.026073041, 6.688396612, 5.580230655 (Made by Maple)
\end{pspicture*}
```

14.4. \psVectorfield

```
\psVectorfield [Options] (x0,y0) (x1,y1) {f'(x,y)}
```

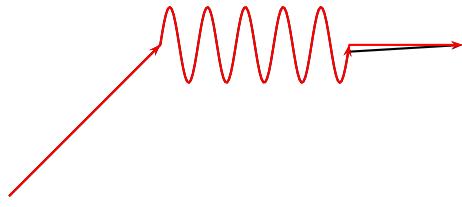

$f'(x,y)$ can be in Postfix notation or with option `algebraic` in Infix notation. The Δx and Δy are given by `Dx` and `Dy` and preset to 0.1, the length of the arrow lines is relative and internally set by `1/0x` with a preset of `0x=3`.

```
%\usepackage{pst-ode}
%%%%%%%%%%%%%
%solve dy/dx=x^2 + y^2 - 1 numerically for different initial values of y in the
%interval x=[-1.1,1.1]; store resulting data points as tables into Postscript
