Typesetting dropped capitals with LaTeX

Daniel Flipo

`daniel.flipo@free.fr`

1 Introduction

The file `lettrine.dtx`[1], provides a command `\lettrine` which requires two mandatory arguments, and an optional one.

Adding `\usepackage{lettrine}` in the preamble of a document defines the command `\lettrine`, the simplest use of which is `\lettrine{`*<letter>*`}{`*<text>*`}`. It produces a dropped capital *<letter>* (2 lines high), followed by *<text>* typeset in small caps, and the rest of the paragraph is wrapped around the dropped capital.

Various parameters are provided to control the size and layout of the dropped capital and match the requirements described in the books

+ "Lexique des règles typographiques en usage à l'Imprimerie nationale" troisième édition (1994), ISBN-2-11-081075-0,

+ "Mise en page et impression" Yves Perrousseaux, ISBN-2-911220-01-3.

The parameters can be set using David Carlisle's `keyval.sty` syntax:

+ lines=*<integer>* sets how many lines the dropped capital will occupy (default=2);

+ depth=*<integer>* sets the number of lines to be reserved under the baseline, this is meant for dropped capital with positive depth, like Q (default=0);

+ lhang=*<decimal>* ($0 \leq$ `lhang` ≤ 1) sets how much of the dropped capital's width should hang into the margin (default=0);

+ loversize=*<decimal>* ($-1 <$ `loversize` ≤ 1) enlarges the dropped capital's height: with `loversize=0.1` its height is enlarged by 10% so that it raises above the top paragraph's line (default=0);

+ lraise=*<decimal>* does not affect the dropped capital's height, but moves it up (if positive), down (if negative); useful with capitals like J or Q which have a positive depth, (default=0);

+ findent=*<dimen>* (positive or negative) controls the horizontal gap between the dropped capital and the indented block of text (default=0pt);

+ nindent=*<dimen>* shifts all indented lines, starting from the second one, horizontally by *<dimen>* (this shift is relative to the first line, default=0.5em);

+ slope=*<dimen>* can be used with dropped capitals like A or V to add *<dimen>* (positive or negative) to the indentation of each line starting from the third one (no effect if lines=2, default=0pt);

---

[1] The file described in this section has version number v2.23 and was last revised on 2020-03-14.

✦ `ante=<text>` can be used to typeset *<text>* *before* the dropped capital (typical use is for French guillemets starting the paragraph).

✦ `image=true` will force `\lettrine` to replace the letter normally used as dropped capital by an image in eps format (latex) or in pdf, jpg, etc. format (pdflatex, xelatex, lualatex); this requires the `graphicx` package to be loaded in the preamble.
`\lettrine[image=true]{A}{n exemple}`   or just
`\lettrine[image]{A}{n exemple}`
will load `A.eps`, `A.jpg`, `A.png` or `A.pdf` instead of letter A.
N.B.: Redefining `\LettrineFont` as `\LettrineFontEPS` is no longer supported and `\LettrineFontEPS` has been renamed as `\LettrineImage`.

✦ `grid=true` will force the vertical skip added above the paragraph starting with `\lettrine` to be rounded up to an integer number of `\baselineskip`. This option is meant for grid typesetting.

✦ `novskip=<dimen>` overrides `\DiscardVskip` (default=0.2pt). In some cases (see options `lraise`, `loversize` or accentuated dropped capitals,…) the top of the dropped capital will raise above the top of following text (usually in small caps), this will trigger a corresponding vertical skip above the paragraph starting with `\lettrine`, *only if* this skip exceeds `\DiscardVskip`. Consider enlarging `novskip` (or `\DiscardVskip`) to prevent small vertical skips from being rounded up to `\baselineskip` when using the 'grid' option.

✦ `realheight=true` will compute the default height of the initial so that the top of it is exactly aligned with the top of the text entered as second mandatory argument of `\lettrine` taking possible accents into account. Otherwise, the default height is computed using a customisable string `\LettrineSecondString` instead of the real argument. For backward compatibility, option `realheight` defaults to `false` and `\LettrineSecondString` to 'x'.

You probably don't need this option if you choose to typeset the second mandatory argument of `\lettrine` in small caps (the default). If you change `\LettrineTextFont` to `\relax` or `\upshape`, consider these two examples:

`\lettrine{H}{ello}` you might like the top of the 'H' to be aligned with the top of the 'll' rather than with the top of the 'e', adding option `realheight` does the trick: `\lettrine[realheight]{H}{ello}`.
Global variants : `\LettrineRealHeighttrue` or (without the `realheight` option) `\renewcommand*{\LettrineSecondString}{l}`.

`\lettrine{L}{a misère}` option `realheight=true` would align with the top of the 'L' with the top of the grave accent, the default is probably better (top of the 'L' aligned with the top of the non accented letters).

✦ `refstring`[2] is meant for fancy initials with irregular heights (i.e. taken in fonts like Yinit (OpenType), `cfr-initials`,…). `refstring` forces the `\fontsize` computations to be run on the initial given as `\lettrine`'s first mandatory argument instead of the reference string `\LettrineTestString`. In most cases, this option should *not* be used: think of accentuated initials or capitals with optical correction.

---

[2]Unlike `grid` or `realheight`, `refstring` is not a flag (*do not* add `=true`!); it is possible to set `refstring=<string>` to override `\LettrineTestString` locally.

Example: `\lettrine[lines=4, lraise=0.1, nindent=0em,  slope=-.5em]%`
`{V}{oici} un exemple ...`

Coloured initials are possible in conjonction with package `color`, examples:
`\lettrine{\textcolor{red}{A}}{n} example`   or
`\lettrine{\textcolor[gray]{0.5}{A}}{nother} one`
see package `color` for the syntax of colour commands. Another possibility to colour initials globally is described below, see `\LettrineFontHook`.

Three dimensions, `\LettrineWidth`, `\LettrineHeight` and `\LettrineDepth`, store the final size of the initial.

Once `lettrine.sty` will be installed (run `lualatex` on `lettrine.ins` to extract it), compile `demo-fr.tex` and `demo-lua.tex` print the resulting PDFs to see the possible usage of these parameters.

The default settings can be customized either in a config file `lettrine.cfg` (for a global usage), or on a per document basis, in the preamble of each document. The following list shows the syntax to set them and their default values:

- `\setcounter{DefaultLines}{2}`,

- `\setcounter{DefaultDepth}{0}`,

- `\renewcommand*{\DefaultLoversize}{0}`,

- `\renewcommand*{\DefaultLraise}{0}`,

- `\renewcommand*{\DefaultLhang}{0}`,

- `\LettrineImagefalse`,

- `\LettrineOnGridfalse`,

- `\LettrineRealHeightfalse`,

- `\LettrineSelfReffalse`,

- `\setlength{\DefaultFindent}{0pt}`,

- `\setlength{\DefaultNindent}{0.5em}`,

- `\setlength{\DefaultSlope}{0pt}`.

- `\setlength{\DiscardVskip}{0.2pt}`.

Instead of giving optional parameters to the `\lettrine` command, it is possible, from version 1.5, to set them on a per character basis in a second config file (suggested by Pascal Kockaert): `\renewcommand{\DefaultOptionsFile}{`*filename*`}` in the preamble (or anywhere in the document) will force each call to `\lettrine` to read the file *filename*. See examples of such config files in the subdirectory `contrib`.

The dimensional parameters `findent`, `nindent` and `slope`, can be set in *filename* relative to `\LettrineWidth` if needed. The settings read from this file will be overridden by the optional arguments eventually given to `\lettrine`.

`\LettrineTextFont` sets the font used for the second argument of `\lettrine`, its default definition is `\newcommand{\LettrineTextFont}{\scshape}` (second argument in small caps), this can be changed using `\renewcommand`.

`\LettrineFont` *is not customisable* see `\LettrineFontHook` below, it sets the font used for the dropped capital, usually the current font in a (large) size, computed automatically from the number of lines it will fill: the font size is computed so that, a *standard* dropped capital (say Z, not À) when sitting on its baseline, gets its top aligned with the top of the following text (provided `loversize = 0` and `lines ≥ 2`). When `lines=1`, size is computed as if `lines` was 2.

A hook `\LettrineFontHook` is provided to change the font used for the dropped capital, syntax follows LaTeX's low-level font interface (see LaTeX Companion, p.187–192), the `\selectfont` command is issued by `\LettrineFont`:
`\renewcommand{\LettrineFontHook}{\fontfamily{ppl}\fontseries{bx}}%`
                                  `\fontshape{sl}},`
selects Palatino bold expanded slanted for the dropped capital.

With LuaLaTeX or XeLaTeX changing the lettrine's font is even easier, simply use the `\fontspec` command:
`\renewcommand{\LettrineFontHook}{\fontspec{LinLibertine_I.otf}`
will switch to Linux Libertine Initials.

`\LettrineFontHook` can also be used to change the colour of all initials in a (part of) document: `\renewcommand{\LettrineFontHook}{\color[gray]{0.5}}`
will colour the initials following this command in grey.

Important notice: the sizing works fine with *fully scalable* fonts (like the standard PostScript fonts), but might not work well with CM/EC fonts which have two limitations: only a limited number of sizes is available by default (precise adjustments are impossible), and the largest size (25pt or 35pt) is often too small. The CM fonts are now available in PostScript type1 format for free (courtesy of BlueSky/Y&Y), to make them fully scalable, it is mandatory to add `\usepackage{type1cm}` in the preamble of your document. The EC fonts are also available in type1 format for free (thanks to Vladimir Volovich, they are called cm-super), and adding `\usepackage{type1ec}`[3] in the preamble will make them fully scalable too. So, if you want `lettrine.sty` to work properly with CM or EC fonts, you will need *PostScript versions* of these fonts *and* one of the packages `type1cm.sty` or `type1ec.sty`.

The LM fonts are a good replacement for both CM and EC fonts they are fully scalable, so you should use them instead of CM or EC fonts. `\usepackage{lmodern}` is the command to switch them on (add `\usepackage[T1]{fontenc}` when composing in one of the western languages other than English in order to get proper hyphenation).

You can also consider using one of the standard PostScript fonts (Palatino, Times, Utopia…), or any OpenType font, they are fully scalable too!

---

[3]This package, available on CTAN, was first released on 2002/07/30.

Known issues:

✦ Nothing is done to prevent page-breaking in a paragraph starting with a dropped capital; when it happens to hang into the footer, page-breaking has to be done manually.

✦ `\lettrine` works within 'quote' 'quotation', 'abstract' environments but does not work within 'center' environments except with option `[lines=1]`.

✦ `\lettrine` does not work within lists.

✦ If a *list* has to be included in a paragraph starting with `\lettrine`, it is necessary to add the command `\parshape=0` just after the end of the list (starting a new paragraph just before or just after the list works too). Remember that 'quote', 'quotation', 'abstract' environments are implemented as *lists* in LaTeX.

✦ If you are facing some slight height inaccuracy for a dropped capital, you can try option `refstring`; this option is meant for fancy (unaccented) initials. Informations about targeted and effective initial's height are available in the `.log` file. Using LuaTeX or XeTeX engines with OpenType fonts may be an option (some TFM files for Type1 fonts are slightly inaccurate).

✦ `\LettrineTestString`'s value has changed over the time; these changes may result in slight size differences for the initial. Starting with version 2.2, the lettrine package takes advantage of the rollback facilities recently introduced by the LaTeX Team[4]. Three rollback versions are provided in order to produce exactly the same output as with former versions: you can request `\usepackage{lettrine}[=v1.6]`[5] for 1999-2012 documents or `\usepackage{lettrine}[=v1.9]` (documents from 2012 to July 2018) or `\usepackage{lettrine}[=v2.0]` (August 2018). Using any date in ISO format works too: `\usepackage{lettrine}[=2014-03-15]` will load v1.9.

2   TEXnical details

The lettrine package now uses the rollback mechanism recently introduced by the LaTeX Team to provide easier backward compatibility. This requires a recent LaTeX kernel (at least 2018-04-01), roolback is ignored with older kernels.

```
1 \ifdefined\DeclareRelease
2   \DeclareRelease{v1.6}{1999-03-03}{lettrine-2006-03-17.sty}
3   \DeclareRelease{v1.9}{2012-07-20}{lettrine-2015-08-31.sty}
4   \DeclareRelease{v2.0}{2018-07-21}{lettrine-2018-08-18.sty}
5   \DeclareCurrentRelease{}{2020-03-14}
6 \else
7   \PackageWarning{lettrine}{Your LaTeX kernel is too old to provide
8     access\MessageBreak to former versions of the lettrine package.%
9     \MessageBreak If you need rollback, please upgrade%
10    \MessageBreak your LaTeX kernel (2018-04-01 or newer),%
11    \MessageBreak otherwise you are fine; reported}
12 \fi
```

---

[4]A LaTeX kernel dated 2018-04-01 or newer is required.

[5]Don't forget the = sign!

This package only runs with LaTeX and requires files `keyval.sty` and `minifp.sty`.

```
13 \RequirePackage{keyval,minifp}
```

Default initializations: define the necessary counters, lengths, and commands to hold the default settings and set these default settings. They can be overwritten in file `lettrine.cfg`.

```
14 \newcounter{DefaultLines}
15 \setcounter{DefaultLines}{2}
16 \newcounter{DefaultDepth}
17 \newcommand*{\DefaultOptionsFile}{\relax}
18 \newcommand*{\DefaultLoversize}{0}
19 \newcommand*{\DefaultLraise}{0}
20 \newcommand*{\DefaultLhang}{0}
21 \newdimen\DefaultFindent
22 \setlength{\DefaultFindent}{\z@}
23 \newdimen\DefaultNindent
24 \setlength{\DefaultNindent}{0.5em}
25 \newdimen\DefaultSlope
26 \setlength{\DefaultSlope}{\z@}
27 \newdimen\DiscardVskip
28 \setlength{\DiscardVskip}{0.2\p@}
29 \newif\ifLettrineImage
30 \newif\ifLettrineOnGrid
31 \newif\ifLettrineRealHeight
32 \newif\ifLettrineSelfRef
```

Then let's define the necessary internal counters, lengths, and commands.

```
33 \newsavebox{\L@lbox}
34 \newsavebox{\L@tbox}
35 \newcounter{L@lines}
36 \newcounter{L@depth}

57 \newif\ifL@image
```

```
58 \newif\ifL@grid
59 \newif\ifL@realh
60 \newif\ifL@selfref
```

Provide commands for the fonts used to typeset the two mandatory arguments of
\lettrine.

\LettrineTextFont   In French, small caps usually follow the dropped capital.

```
61 \newcommand*{\LettrineTextFont}{\scshape}
62 \newcommand*{\LettrineSecondString}{x}
```

\LettrineFontHook   \LettrineFontHook enables to select another font for the dropped capital. Its default
definition is empty (the current text font is used).

```
63 \newcommand*{\LettrineFontHook}{}
```

\computeL@height   The default size for the dropped capital is computed so that the top of it is exactly
aligned with the top of the following text; an extra height (positive or negative) may be
added globally by redefining \Defaultloversize or locally using optional argument
loversize=. If lines=1, the default size for the dropped capital is computed as if
lines=2.
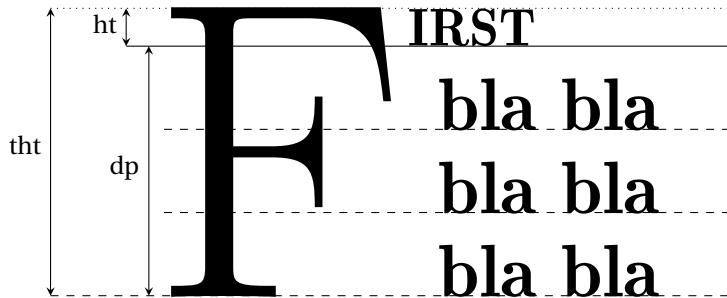

Figure 1: Initial's targeted dimensions (\lines = 4)

\computeL@height first computes the targeted height for the dropped capital and
stores it into \L@target@tht. This height only depends on L@lines and on the height
of \L@tbox (see fig. 1). So options *must* be read and \L@tbox must be properly ini-
tialised *before* executing \computeL@height (see below in \@lettrine code).

\L@height is set to \L@target@tht raised by the \L@oversize factor.

```
64 \def\computeL@height{%
65   \setlength{\L@target@ht}{\ht\L@tbox}%
```

As \baselineskip might be a rubber length, let's convert it into a 'dimen' using
\@tempdima.

```
66   \@tempdima=\baselineskip
67   \setlength{\L@target@dp}{\value{L@lines}\@tempdima}%
68   \ifnum\value{L@lines}>1
69     \addtolength{\L@target@dp}{-\@tempdima}%
70   \else
```

7

```
71    \addtolength{\L@target@ht}{\L@target@dp}%
72    \setlength{\L@target@dp}{0pt}%
73  \fi
74  \setlength{\L@target@tht}{\L@target@ht}%
75  \addtolength{\L@target@tht}{\L@target@dp}%
76  \setlength{\L@height}{\L@target@tht}%
77  \addtolength{\L@height}{\L@oversize\L@target@tht}%
78 }
```

\LettrineTestString   After executing `\computeL@height`, `\L@height` holds the exact height required for the dropped capital, nothing more is needed if the initial is a picture, otherwise we need to compute the matching `\fontsize`'s value. This is done by measuring the height of a "reference" capital (i.e. either listed in `\LettrineTestString` or the initial itself). As some font designers apply optical correction to capitals C, G, O, or Q (they are slightly taller than 'T' or 'Z'), they are better left out of `\LettrineTestString`. EFTZ should be a good default for most fonts.

```
79 \newcommand*{\LettrineTestString}{EFTZ}
```

\compute@fontsize   This command compares the height of a "reference" capital scaled by `\fontsize` with argument `\L@height` to `\L@height` (the required height for the initial); both are converted into integers (in sp) to compute a ratio `\L@factor`. Up to v2.01, possible values for `\L@factor` were either 1 or any value ≥ 1.1 which was fine for almost every font but not all (i.e. `cfr-initials`). Starting with v2.1, `\L@factor` is computed more accurately by `\MFPdiv` from `minifp.sty`.

When optional argument `selfref` is `true` the initial itself is taken as reference to compute `\fontsize`, this can be handy when working with fancy fonts (i.e. cfr-initials, Yinit). In most cases, the default is a better choice.

```
80 \def\compute@fontsize{%
81   \ifL@selfref
82     \def\Lettrine@RefString{\l@refstring}%
83   \else
84     \def\Lettrine@RefString{\LettrineTestString}%
85   \fi
86   \sbox{\@tempboxa}{\LettrineFontHook
87                     \fontsize{\L@height}{\L@height}\selectfont
88                     \Lettrine@RefString}%
89   \@tempcnta=\ht\@tempboxa
90   \ifnum\@tempcnta=0
91     \PackageWarning{lettrine}{Unable to compute \protect\fontsize!%
92     \MessageBreak \protect\LettrineTestString\space empty? reported}
93     \def\L@factor{1}%
94   \else
95     \@tempcntb=\L@height
96     \MFPdiv{\the\@tempcntb}{\the\@tempcnta}\L@factor
97   \fi
98 }
```

\LettrineFont   `\fontsize`'s argument providing the requested `\L@height` is `\L@factor\L@height`.

```
99 \newcommand*{\LettrineFont}{%
100    \LettrineFontHook
```

```
101    \fontsize{\L@factor\L@height}{\L@factor\L@height}%
102    \selectfont
103 }
```

\LettrineImage   The following definition is for use with dropped capitals defined as images: EPS,
PDF, JPG, PNG files (see examples in demo-fr.tex). Its use requires the `graphicx`
package to be loaded in the preamble with `\usepackage{graphicx}`. The required
size is computed just as in the standard case, `\includegraphics` prints the image at
this size.

```
104 \newcommand*{\LettrineImage}{%
105    \LettrineFontHook\includegraphics[height=\L@height]%
106 }
```

\setupL@lbox   The next (internal) command computes the requested size for the initial (letter or
image) and prepares a box `\L@lbox` holding it.

```
107 \def\setupL@lbox{%
108    \computeL@height
109    \ifL@image
110      \sbox{\L@lbox}{\LettrineImage{\l@initial}}%
111    \else
112      \compute@fontsize
113      \sbox{\L@lbox}{\LettrineFont \l@initial}%
114    \fi
115 }
```

Set up keyval initializations.

```
116 \define@key{L}{lines}{\setcounter{L@lines}{#1}}
117 \define@key{L}{depth}{\setcounter{L@depth}{#1}}
118 \define@key{L}{lhang}{\renewcommand*{\L@hang}{#1}}
119 \define@key{L}{loversize}{\renewcommand*{\L@oversize}{#1}}
120 \define@key{L}{lraise}{\renewcommand*{\L@raise}{#1}}
121 \define@key{L}{ante}{\renewcommand*{\L@ante}{#1}}
122 \define@key{L}{findent}{\setlength{\L@Findent}{#1}}
123 \define@key{L}{nindent}{\setlength{\L@Nindent}{#1}}
124 \define@key{L}{slope}{\setlength{\L@slope}{#1}}
125 \define@key{L}{image}[true]{\csname L@image#1\endcsname}
126 \define@key{L}{grid}[true]{\csname L@grid#1\endcsname}
127 \define@key{L}{realheight}[true]{\csname L@realh#1\endcsname}
128 \define@key{L}{novskip}{\setlength{\L@novskip}{#1}}
129 \define@key{L}{refstring}[\l@initial]{\L@selfreftrue
130                                        \def\l@refstring{#1}}
```

\LettrineOptionsFor   This command is to be used in an optional config file (the name of which is found in
`\DefaultOptionsFile`) to set the values of parameters on a per character basis, for
instance:
`\LettrineOptionsFor{A}{slope=0.6em, findent=-1em, nindent=0.6em}`
creates an internal command (`\l@A-keys` in this example), which expands to the
options given as second argument of `\LettrineOptionsFor` for letter 'A'.

```
131 \newcommand*{\LettrineOptionsFor}[2]{\@namedef{l@#1-keys}{#2}}
```

\lettrine   Now let's define `\lettrine`.

```
132 \def\lettrine{\@ifnextchar[\@lettrine{\@lettrine[]}}
133 \def\@lettrine[#1]#2#3{%
134   \def\l@initial{#2}\let\l@refstring\l@initial
```

First reset the parameters to their default values:

```
135   \setcounter{L@lines}{\value{DefaultLines}}%
136   \setcounter{L@depth}{\value{DefaultDepth}}%
137   \renewcommand*{\L@hang}{\DefaultLhang}%
138   \renewcommand*{\L@oversize}{\DefaultLoversize}%
139   \renewcommand*{\L@raise}{\DefaultLraise}%
140   \renewcommand*{\L@ante}{}%
141   \setlength{\L@Findent}{\DefaultFindent}%
142   \setlength{\L@Nindent}{\DefaultNindent}%
143   \setlength{\L@slope}{\DefaultSlope}%
144   \setlength{\L@novskip}{\DiscardVskip}%
145   \ifLettrineImage\L@imagetrue\else\L@imagefalse\fi
146   \ifLettrineOnGrid\L@gridtrue\else\L@gridfalse\fi
147   \ifLettrineRealHeight\L@realhtrue\else\L@realhfalse\fi
148   \ifLettrineSelfRef\L@selfreftrue\else\L@selreffalse\fi
```

The final initial size depends on the height of `\L@tbox`; the content of `\L@tbox` depends on option realheight, so we have to read `\lettrine`'s optional argument and initialise the `\L@tbox` content now[6].

```
149   \setkeys{L}{#1}%
150   \sbox{\L@tbox}{\LettrineTextFont{\LettrineSecondString}}%
151   \ifL@realh
152     \def\@tempa{#3}%
153     \ifx\@tempa\@empty
154       \PackageWarning{lettrine.sty}%
155         {Empty second argument,\MessageBreak
156           ignoring option `realheight';}%
157     \else
158       \sbox{\L@tbox}{\LettrineTextFont{#3}}%
159     \fi
160   \fi
```

Then try to read an optional file (its name is given by `\DefaultOptionsFile`), do this inside a group, and define a global command `\l@LOKeys` which will expand to the list of options given by `\LettrineOptionsFor` for the current initial (defined by #2)…

```
161   \if\DefaultOptionsFile\relax
162   \else
163     \begingroup
164     \InputIfFileExists{\DefaultOptionsFile}%
165       {}%
166       {\PackageWarning{lettrine.sty}%
167         {File \DefaultOptionsFile\space not found}%
168       }%
```

Gobble the colour commands, just keep the letter argument.

---

[6]Now means before eventually reading the config file.

10

```
169    \def\color##1##{\l@color{##1}}%
170    \let\l@color\@gobbletwo
171    \def\textcolor##1##{\l@textcolor{##1}}%
172    \def\l@textcolor##1##2##3{##3}%
```

Save the list of options relevant to the letter in #2 in \l@LOKeys (list is empty eventually).

```
173    \expandafter\ifx\csname l@#2-keys\endcsname\relax
174                  \gdef\l@LOKeys{}%
175                \else
176                  \xdef\l@LOKeys{\csname l@#2-keys\endcsname}%
177                \fi
178    \endgroup
```

Now apply these options (the following code executes \setkeys{L}{\l@LOKeys}} where \l@LOKeys is expanded, see keyval.sty).

```
179    \def\KV@prefix{KV@L@}%
180    \let\@tempc\relax
181    \expandafter\KV@do\l@LOKeys,\relax,
```

As some parameters' values findent, nindent and slope —which do not influence the initial's size— may be given relative to \LettrineWidth, the \L@lbox has to be set up to evaluate \LettrineWidth.

```
182    \setupL@lbox
183    \setlength{\LettrineWidth}{\wd\L@lbox}%
184    \def\KV@prefix{KV@L@}%
185    \let\@tempc\relax
186    \expandafter\KV@do\l@LOKeys,\relax,
```

As local options prevail on those held in the config file, we have to read local options again:

```
187    \setkeys{L}{#1}%
188  \fi
```

Options and optional config file have be taken into account, we can now finally save the first mandatory argument of \lettrine properly scaled into \L@lbox.

```
189    \setupL@lbox
```

Store the initial's final dimensions,

```
190  \setlength{\LettrineWidth}{\wd\L@lbox}%
191  \setlength{\LettrineHeight}{\ht\L@lbox}%
192  \setlength{\LettrineDepth}{\dp\L@lbox}%
```

print some informations about accuracy to the log file,

```
193  \begingroup
194  \def\IeC##1{##1}%
195  \@tempdima=\L@oversize pt\relax
196  \PackageInfo{lettrine.sty}%
197    {Targeted height = \the\L@target@tht\MessageBreak
198     (for loversize=0, accent excluded),\MessageBreak
199     Lettrine height = \the\LettrineHeight\space (#2)%
200     \ifdim\@tempdima=\z@\else\space loversize=\L@oversize\fi;%
201     \MessageBreak reported}%
```

```
202    \endgroup
```

and reset `\L@tbox`'s content (mandatory in case `realheight=false`):

```
203    \sbox{\L@tbox}{\LettrineTextFont{#3}}%
```

Start a new paragraph, skipping the necessary amount of space if the dropped capital sticks out of the top of paragraph. We use `\L@first` to compute the amount of space to be skipped.

The basis for `\L@raise` (and `\L@oversize`, see `\LettrineFont`) is `\L@target@tht`.

```
204    \setlength{\L@first}{\LettrineHeight}%
205    \setlength{\L@lraise}{\L@raise\L@target@tht}%
206    \addtolength{\L@first}{\L@lraise}%
207    \ifnum\value{L@lines}=1
208      \addtolength{\L@first}{-\ht\L@tbox}%
209    \else
210      \addtolength{\L@first}{-\L@target@tht}%
211      \addtolength{\L@lraise}{-\L@target@dp}%
212    \fi
213    \par
```

`\L@first` now holds the height of the needed `\vskip`; if too small it will be discarded.

```
214    \ifdim\L@first>\L@novskip
```

When the `grid` option is `true`, let's round up `\L@first` to the next integer number of `\baselineskip`.

```
215      \ifL@grid
216        \@tempdima=\baselineskip
217        \@tempdimb=\@tempdima
218        \advance\@tempdimb by \L@novskip
219        \@tempcnta=1
220        \loop\ifdim\L@first>\@tempdimb
221          \advance\@tempcnta by 1
222          \advance\L@first by -\@tempdima
223        \repeat
224        \L@first=\@tempcnta\baselineskip
225      \fi
226      \vskip\L@first
227    \fi
```

Again, we (mis)use the length `\L@first` to compute the width of the text eventually coming before the dropped capital. It is reset later on to hold the first line's length.

```
228    \setlength{\L@Pindent}{\wd\L@lbox}%
229    \addtolength{\L@Pindent}{-\L@hang\wd\L@lbox}%
230    \settowidth{\L@first}{\L@ante}%
231    \addtolength{\L@Pindent}{\L@first}%
232    \addtolength{\L@Pindent}{\L@Findent}%
233    \setlength{\L@first}{\linewidth}%
234    \addtolength{\L@first}{-\L@Pindent}%
```

Now let's compute `\L@Nindent` and `\L@next` for the next lines.

```
235    \addtolength{\L@Nindent}{\L@Pindent}%
```

```
236    \setlength{\L@next}{\linewidth}%
237    \addtolength{\L@next}{-\L@Nindent}%
```

This is for quotation, quote, abstract… environments: \linewidth is set by these
environments, all we have to do is to shift our text left by \@totalleftmargin.

```
238    \addtolength{\L@Pindent}{\@totalleftmargin}%
239    \addtolength{\L@Nindent}{\@totalleftmargin}%
```

Now, set up the shape of the new paragraph (designed by \parshape).

```
240    \addtocounter{L@lines}{1}%
241    \addtocounter{L@lines}{\value{L@depth}}%
242    \def\L@parshape{\c@L@lines \the\L@Pindent \the\L@first}%
243    \@tempcnta=\tw@
244    \@whilenum \@tempcnta<\c@L@lines\do{%
245       \edef\L@parshape{\L@parshape \the\L@Nindent \the\L@next}%
246       \addtolength{\L@Nindent}{\L@slope}%
247       \addtolength{\L@next}{-\L@slope}%
248       \advance\@tempcnta\@ne}%
249    \edef\L@parshape{\L@parshape \@totalleftmargin \the\linewidth}%
250    \noindent
251    \parshape=\L@parshape\relax
```

Write the dropped capital into the left margin, and wrap the rest of paragraph around
it.

```
252    \smash{\llap{\mbox{\L@ante}\raisebox{\L@lraise}{\usebox{\L@lbox}}%
253           \hskip \the\L@Findent}}%
254    \usebox{\L@tbox}%
```

A \parshape reset is required in abstract, quote and quotation environments begin-
ning with \lettrine and spreading over several paragraphs. When the list ends,
\parshape returns to 0.

```
255    \ifnum\@listdepth>0 \Lreset@listparshape \fi
256 }
```

This ends the definition of \lettrine; \Lreset@listparshape adds the parshape
reset to the first occurence of \everypar following the \lettrine command.

```
257 \newtoks\Llist@everypar
258 \def\Lreset@listparshape{%
259    \let\Lnew@everypar\everypar
260    \Llist@everypar=\expandafter{\the\everypar}%
261    \Lnew@everypar={\the\Llist@everypar
262                   \parshape=\@ne \@totalleftmargin \linewidth \relax
263                   \let\everypar\Llist@everypar
264                   }%
265 }
```

Load a local config file if present in LaTeX's search path.

```
266 \InputIfFileExists{lettrine.cfg}
267    {\typeout{Loading lettrine.cfg}}
268    {\typeout{lettrine.cfg not found, using default values}}
```

3 Configuration file

```
269 %% lettrine.cfg: configuration file for lettrine.sty
270 %%
271 %% If you want to customize lettrine, please *do not* hack into the
272 %% code, copy this file to your working directory and customize the
273 %% copy as you like.
274 %%
275 %% Uncomment any of these lines and change the parameters' values
276 %% to fit your needs (see lettrine.dtx).
277 %%
278 %%\setcounter{DefaultLines}{2}
279 %%\setcounter{DefaultDepth}{0}
280 %%
281 %% These are *decimal* numbers:
282 %%\renewcommand*{\DefaultLoversize}{0}
283 %%\renewcommand*{\DefaultLraise}{0}
284 %%\renewcommand*{\DefaultLhang}{0}
285 %%
286 %% These are *lengths* (don't forget the unit):
287 %%\setlength{\DefaultFindent}{0pt}
288 %%\setlength{\DefaultNindent}{0.5em}
