Garamond-Math, Ver. 2019-08-16

Yuansheng Zhao, Xiangdong Zeng

November 16, 2019

1 Introduction

Garamond-Math is an open type math font matching the *EB Garamond (Octavio Pardo)*[1] and *EB Garamond (Georg Mayr-Duffner)*[2]. Many mathematical symbols are derived from other fonts, others are made from scratch. The metric is generated with a python script.

The font is mostly tested with X⅁TEX, though it shoule also work with LuaTEX.

Issues, bug reports, forks and other contributions are welcome. Please visit GitHub[3] for development details.

A minimal example with `unicode-math` package is as following:

```
%Compile with `xelatex' command
\documentclass{article}
\usepackage[math-style=ISO, bold-style=ISO]{unicode-math}
\setmainfont{EB Garamond}%You should have installed the font
\setmathfont{Garamond-Math.otf}[StylisticSet={7,9}]%Use StylisticSet that you like
\begin{document}
    \[x^3+y^3=z^3.\]
\end{document}
```

The result shoule be

$$x^3 + y^3 = z^3.$$

2 Alphabets & StylisticSets

Latin and Greek (StylisticSet 4/5 give semi/extra bold for `\symbf`)

\partial: (StylisticSet 2 → curved ones)

$$\partial_\mu(\partial^\mu\phi) - \epsilon^{\lambda\mu\nu}\partial_\mu(A_\lambda\partial_\nu f)$$

$$\partial_\mu(\partial^\mu\phi) - \epsilon^{\lambda\mu\nu}\partial_\mu(A_\lambda\partial_\nu f)$$

\hbar: (StylisticSet 6 → horizontal bars)

$$\hbar \qquad \hbar$$

Italic *h*: (StylisticSet 10 → out-bending ones)

$$\hbar = \frac{h}{2\pi} \qquad \hbar = \frac{h}{2\pi}$$

\tilde: (StylisticSet 9 → "normal" ones)

$$\tilde{F} \qquad \tilde{F}$$

\int: (StylisticSet 7 → a variant with inversion symmetry)

$$\oint_{\partial\Sigma} \vec{E} \cdot d\vec{l} = -\frac{1}{c}\frac{d}{dt}\iint_\Sigma \vec{B} \cdot d\vec{S}$$

$$\oint_{\partial\Sigma} \vec{E} \cdot d\vec{l} = -\frac{1}{c}\frac{d}{dt}\iint_\Sigma \vec{B} \cdot d\vec{S}$$
Binany Operators: (StylisticSet 11 → larger ones)

$$s = A + b \times 1 \div x^3$$

$$s = A + b \times 1 \div x^3$$

Extensible Arrow Hack

The font contains the math table for constructing extensible arrow. However `unicode-math` does not privode an interface to that. In LuaTeX one can use \Uhextensible[7]. A more general solution is to add the following code in preamble.

```
\usepackage{extarrow} %or mathtools
\makeatletter
\renewcommand{\relbar}{\symbol{"E010}\mkern-.2mu\symbol{"E010}\mkern1.8mu}
\renewcommand{\Relbar}{\symbol{"E011}\mkern-.2mu\symbol{"E011}\mkern1.8mu}
\makeatother
```

Then \xleftarrow and other commands will work:

$$CH_3COOH + C_2H_5OH \xrightarrow[\Delta]{H_2SO_4} CH_3COOC_2H_5 + H_2O.$$

3   Known Issue

- Various spacing problems. Though math fonts technically should not be kerned, some pairs looks very ugly (Ex. VA); sometimes sub/superscript may also have same problem. However, do note that due to the mechanism in math mode, making all spacing look perfect is amlost impossible (as far as I can do, and low x-height and large italic angle only make things even worse), in many cases, adjusting manually (i.e. using \, or \!) is required.

- Fake optical size. EB Garamond does not contain a complete set of glyphs (normal + bold + optical size of both weights). The "optical size `ssty`" is made by interpolating different weights at the present (without this, the double script is too thin to be readable).
